APPLICATION GUIDELINES

In accordance with Arizona Revise Statutes ("A.R.S.") §§ 41-1008 and 1079, the Department of Water Resources (Department) provides the following information regarding the application review process for authority to drill.

NECESSARY STEPS & INSTRUCTIONS TO OBTAIN DRILLING AUTHORITY

1. Pursuant to A.R.S. § 45-596, a person may not drill, cause to be drilled, deepen or modify any well for which a permit is not required without first filing a Notice of Intent to Drill with the Department. Only a well drilling contractor licensed in the State of Arizona or a single well licensee (a person licensed to drill or modify one exempt well on his or her own property) is authorized to drill, deepen or modify a well. Drilling may not begin until the well drilling contractor or licensee has possession of a drilling card at the well site, issued by the Director in the name of the well drilling contractor or licensee, and which authorizes the drilling of the specific well in a specific location. To assist you in understanding the requirements for this application, copies of A.R.S. § 45-596 and Arizona Administrative Code ("A.A.C.") R12-15-810 are available at the Department bookstore (602-417-2450 x7127).
2. If replacing, deepening or modifying an existing well, provide the registration number of the existing well in item 2. A replacement well is one located no more than 660 feet from the original well and that is not expected to annually withdraw more groundwater than historically withdrawn from the original well.
3. Information to complete items 3, 4, 5 and 14 may be available from your driller.
4. Information to complete items 10 and 13 may be available from your County Assessor's Office.
5. An exempt well, referred to in Item 11, means a well with a pump with a maximum capacity of not more than thirty-five gallons per minute used primarily for domestic purposes, including the noncommercial irrigation of less than two acres of land.
6. If any water from a proposed well on a parcel of twenty or fewer acres will be used for domestic purposes, as defined in § 45-454, the applicant must submit a well site plan of the property. The plan must be on an 8½" x 11" piece of plain paper with representation of the locations of all structures and proximity of adjacent lot lines, to scale. It must include the county assessor's parcel identification number. The plan must show the proposed well location and the location of any septic tank or sewer system that is either located on the property or within one hundred feet of the proposed well site, as well as indicating the measured shortest distance between the proposed well and existing septic tank system. **The plan must demonstrate that the well will not be drilled within one hundred feet of any septic or sewer system.**
7. The site plan must be approved by the county health authority, or by a local health authority in areas where the county health authority has delegated authority to approve septic or sewer systems. Endorsement by the county/local authority is based solely on the best available judgement that the proposed well, as shown on the site plan submitted, is 100 feet or more from all known and visually identifiable sewage treatment systems. It is not a representation that a well placed at this site will be guaranteed as to quantity or quality. In areas where there is no local or county authority that controls installation of septic tanks or sewer systems, or if the health authority is unable to determine whether the proposed well location complies with state and local requirements, the applicant must apply for approval directly to the Department of Water Resources.
8. If an individual other than the land owner or lessee signs this notice, an original letter of authorization from the land owner/lessee, stating that the individual has permission to sign this specific notice on his or her behalf, must accompany the notice.
9. Please mail **two original Notices** with **original signatures** and **two site plans** and, in accordance with A.R.S. § 45-113, a **check or money order (no cash) in the amount of $10.00** to P. O. Box 458, Phoenix Arizona, 85001-0458, or hand deliver to 500 North Third Street, Phoenix, Arizona.
10. Arizona Revised Statute § 45-596(D) provides that the Director of the Department is to determine whether or not all information required on this form has been submitted. If not, the person filing the Notice will be notified, and the drilling or modification of the well may **not** proceed.
11. This form is not applicable for non-exempt wells (those yielding more than thirty-five gallons per minute) within an Active Management Area. Contact Groundwater Management for further information regarding the appropriate notice to file with the Department.

TIME FRAME FOR REVIEW OF YOUR APPLICATION

Within 15 days after receipt of your Notice of Intention, the Arizona Department of Water Resources ("Department") will determine whether your application should be granted or denied, unless this time is extended for lack of a complete application. If your application is incomplete, the Department will notify you in writing and will specify what information is necessary to make the application complete. Until the missing information is received, the time frame for review of your application will be suspended. Your application will not be complete until all of the requested information is received. If you do not supply the missing information within sixty (60) days, the Department may deem your application withdrawn and close the file.

At the end of its review, the Department will send you written notice either granting or denying your application for drilling authority. If your application is approved, the Drill Card will be mailed directly to the drilling company. If denied, the Department's notice will state justification for the denial and an explanation of your right to appeal.

CONSTRUCTION AND FOLLOW UP REQUIREMENTS

1. Construction and abandonment standards for wells, including abandonment, must be in accordance with Department Regulations. A.R.S. § 45-594 and Arizona Administrative Code R12-15-811 require the well to be constructed with a twenty foot steel surface seal casing, including a one foot steel stickup and one and one-half inches of grout seal, unless a variance is granted **(see A.R.S. § 45-596 (G) for procedure to follow in requesting a variance).**
2. Pursuant to § 45-596(E), the drilling, deepening or modification of the well must be completed within one year of the date of the Notice of Intent. If the well is not completed within one year, a new Notice of Intent must be filed before proceeding with further construction.
3. If a well which was originally drilled as an exploration well, a monitor well, a piezometer well or for any use other than domestic use is later proposed to be converted to use for domestic purposes as defined in § 45-454, the well owner must file a Notice of Intention to Drill and comply with the requirements of § 45-596 before the well is converted and any water from that well is used for domestic purposes.
4. Within thirty days after installation of pumping equipment, the registered well owner must file a Completion Report with the Department. The person to whom a well is registered also must notify the Department of a change in ownership or a change in data relating to this well.

Registration No. 55-577927
File No.D(24-24) 2 CBB

Dear Well Owner:

Enclosed is a copy of the Notice of Intention (NOI) to drill a well. This NOI, which was recently filed with this Department, is being returned to you as evidence of your compliance with ARS §45-596. The enclosed Completion Report is to be submitted when pump equipment is installed. The Drilling Card and Well Drilling Report form have been sent to your driller. He may not begin drilling until he has received the Drilling Card and it must be displayed on the rig during drilling. If you change drillers, you must supply this Department with the new driller's identity. Please ensure that the driller you select is licensed to drill the type of well you require. All well drillers must pass an examination proving they understand the drilling methods for that particular license, and are familiar with the laws and regulations which govern well construction in Arizona.

If it is necessary to change the location of the proposed well, immediately contact the Department of Water Resources to obtain written permission before proceeding with the drilling. A properly signed, amended Drilling Card must be in the possession of the driller before drilling commences at a different location than originally authorized.

ARS §45-600 requires the registered well owner to submit a completion report within thirty (30) days after the installation of pumping equipment. It also requires the driller to furnish this Department a complete and accurate log of the well within thirty (30) days after completion of drilling. You should insist, and ensure, that both of these are done.

If in the course of drilling a new well, it is determined that the new well cannot be successfully completed as initially intended (dry hole, cave in, lost tools, etc.), the new well must be properly abandoned and a Well Abandonment Completion Report submitted per R12-15-816.F.

Per ARS §45-593 (C), the person to whom a well is registered shall notify this Department of a change in ownership of the well and/or information pertaining to the physical characteristics of the well in order to keep this well registration file current and accurate. We have enclosed a Change of Well Information Form should it be needed in the future.

Sincerely,

Sylvia Valdez
Water Resource Technician

20. Include detailed construction diagram showing expected water depth in feet below land surface, and details of vault, if specified.

CONDITIONS

I. Construction and abandonment standards for all wells shall be in accordance with A.A.C. R12-15-811 and R12-15-816.

II. Drilling of the well shall be completed within one (1) year after the date of Notice.

III. A Well Driller Report, is required within 30 days of completion of drilling. A completion Report, is required to be filed with the Department within 30 days after installation of pump equipment for monitor wells.

IV. Pump equipment may not be installed on a well drilled for piezometer purposes. If a monitor well is pumped, pumping is limited to the maximum amount required for monitor purposes, but in no case may exceed 35 gallons per minute and an annual volume of 10 acre feet total.

V. A.A.C. Rule R12-15-811.H.2, requires that: "A monitor well shall be identified as such on the vault cover or at the top of the steel casing. Identification information will include well registration number."

VI. If the proposed well is located near the Colorado River and if the proposed well may pump Colorado River Water, proof must be submitted with this notice that the applicant has the legal right to use Colorado River Water. Alternately, evidence needs to be submitted that supports the contention that Colorado River water will not be withdrawn by the well. Persons near the Colorado River may wish to contact the Colorado River Management Division, Department of Water Resources at (602) 542-1960 to determine those Townships and Ranges which will be affected by these requirements or with questions regarding the proof of right.

VII. Special construction standards required pursuant to A.A.C. Rule R12-15-821: _____

Dear Well Owner:

Enclosed for your records is an annotated copy of the Notice of Intention to Drill a well. This is returned to you as evidence of compliance with A.R.S. §45-596. A drilling card has been mailed to your designated driller. Prior to drilling he must have it in his possession.

Since this well is being drilled as a Monitor well, or for Cathodic Protection, Grounding, Geotechnical or Piezometer purposes, our standard driller report form is also being furnished. He is required to complete it and return it to the Department within 30 days after the installation of the pumping equipment as required by A.R.S. §45-600.

A Change of Well Information form is enclosed for your future use . If you deem it necessary to change the location of the proposed well, please notify the Department on the enclosed form. A properly amended Drilling Card will then be issued and must be in possession of the driller before drilling begins. During the drilling of a new well, if it is determined that it must be abandoned, then a Well Abandonment Completion Report must be submitted per R12-15-816.F. Per A.R.S. §45-593, the person to whom a well is registered shall notify this Department of a change of ownership of the well and/or information pertaining to the physical characteristics of the well, in order to keep the well registration file current and accurate.

For additional information, you may contact the Operations Division at (602) 542-1581.

Sincerely,

Ellen Kane

WELL DRILLER REPORT

This report should be prepared by the driller in all detail and filed with the Department within 30 days following completion of the well.

1. Owner Name: Phelps Dodge
   Address: 2600 N. Central Ave. Phoenix AZ 85012
   (Street / City / State / Zip)
2. Driller Name: Stewart Brothers Drilling Company
   Address: PO Box 2067 Milan NM 87021
   (Street / City / State / Zip)
3. Location: 24S N/S (Township) 24E E/W (Range) 4 (Section) NE 1/4 (10-acre) NE 1/4 (40-acre) NE 1/4 (160-acre)
4. Well Registration No. 55-539783 (Required)
5. Permit No. _____ (If issued)

DESCRIPTION OF WELL

6. Total depth of hole 400 ft.
7. Type of casing low carbon steel
8. Diameter and length of casing 10 in. from +1 to 20, 4 in from +1 to 325.
9. Method of sealing at reduction points _____
10. Perforated from _____ to _____, from _____ to _____, from _____ to _____.
11. Size of cuts _____ Number of cuts per foot _____
12. If screen was installed: Length 60 ft. Diam 4 in. Type PVC Slotted (325-385)
13. Method of construction drilled
    (drilled, dug, driven, bored, jetted, etc)
14. Date started August (Month) 14 (Day) 1993 (Year)
15. Date completed August (Month) 15 (Day) 1993 (Year)
16. Depth to water _____ ft. (If flowing well, so state)
17. Describe point from which depth measurements were made, and give sea-level elevation if available
    ground level
18. If flowing well, state method of flow regulation: _____
19. Remarks: _____

NOTICE OF INTENTION TO DRILL MONITOR/PIEZOMETER WELL

60

ection § 45-596, Arizona Revised Statutes provide: Prior to drilling a monitor or piezometer well, a Notice of ntention to Drill shall be filed with the Department on a prescribed form.

1. WELL LOCATION:
   24 N/S | 24 E/W | 34
   Township | Range | Section
   10 Acre Subdivision
   NE NW 1/4 — NE NW 1/4 — NE NW 1/4
   10 ACRE — 40 ACRE — 160 ACRE

2. Position location of the well on the land:
   Latitude 31 0 22 · 45 "
   Longitude 109 0 54 · 05 "

3. County: Cochise

4. Owner of the land of wellsite:
   Phelps Dodge
   Name
   2600 N. Central Ave.
   Address
   Phoenix AZ 85004-3014
   City State Zip

5. Lessee of the land of wellsite:
   Name
   Address
   City State Zip

6. Owner of well:
   Same
   Name
   Address
   City State Zip

7. Consulting Firm: CEC/WRA
   Contact Person: Marvin Glotfelty
   Phone: (602) 248-8808

8. Purpose of well drilled pursuant to this notice
   Monitor X
   Piezometer

9. If for deepening or modifying, Well Registration Number
   55-

10. Construction will start:
    07 Month 15 Day 93 Year

11. Period well will remain in use 10 Months (Years)

12. For monitoring wells, is pump equipment to be installed?
    Yes ____ No X
    (a) If yes, design pump capacity
    (b) What use will be made of the water

13. Drilling firm:
    Forrest Pump
    Name
    800 East Maley
    Address
    Wilcox, Az. 85643
    City State Zip
    DWR License No. 307
    A-16 #85412 C-53
    ROC Category

14. Will this proposed well pump Colorado River water? Yes ____ No X
    (See condition VI on reverse)

15. Is the proposed wellsite within 100 feet of a septic tank system, sewage disposal area, landfill, hazardous waste facility, storage area of hazardous material or petroleum storage areas and tanks?
    Yes X No ____

If construction plans have been coordinated with Arizona Department of Water Resources, Hydrology/Water Quality Division, who is the division contact? _____

19. WELL CONSTRUCTION PLAN

a) Drilling method (mud rotary, hollow-stem auger, etc.) Air Rotary

b) Borehole diameters: 13 3/4 inches from surface feet to 20 feet.
~~8 1/2~~ inches from 20 feet to 280 feet.

c) Casing materials (PVC, steel, hollow-stem auger, etc.)

material LC Steel diameter 9 5/8 inches from 0 feet to 20 feet

material LC Steel diameter 4 1/2 inches from 0 feet to 230 feet

d) Method of sealing at reductions ~~PVC SCH80 4½"~~ ~~230~~ ~~270~~

e) Annular seal materials (cement, grout, etc.); method of placement (tremied, circulated)

material grout method tremie from 0 feet to 210 feet

material ~~g~~ Bentonite method tremie from 210 feet to 220 feet

f) Filter packs (state material):

material 10/20 Colorado Silica from 220 feet to 280 feet

material _____ from _____ feet to _____ feet

g) Perforations or screen specifications:

type PVC SCH80 from 230 feet to 270 feet

type _____ from _____ feet to _____ feet

h) Method of well development (bail, air lift, surge) _____

i) Will surface or conductor casing extend above grade: Yes X No _____

20. Include detailed construction diagram showing expected water depth in feet below land surface, and details of vault, if specified.

CONDITIONS

I. Construction and abandonment standards for all wells shall be in accordance with A.A.C. R12-15-811 and R12-15-816.

II. Drilling of the well shall be completed within one (1) year after the date of Notice.

III. A Well Driller Report, is required within 30 days of completion of drilling. A completion Report, is required to be filed with the Department within 30 days after installation of pump equipment for monitor wells.

IV. Pump equipment may not be installed on a well drilled for piezometer purposes. If a monitor well is pumped, pumping is limited to the maximum amount required for monitor purposes, but in no case may exceed 35 gallons per minute and an annual volume of 10 acre feet total.

V. A.A.C. Rule R12-15-811.H.2, requires that: "A monitor well shall be identified as such on the vault cover or at the top of the steel casing. Identification information will include well registration number."

VI. If the proposed well is located near the Colorado River and if the proposed well may pump Colorado River Water, proof must be submitted with this notice that the applicant has the legal right to use Colorado River Water. Alternately, evidence needs to be submitted that supports the contention that Colorado River water will not be withdrawn by the well. Persons near the Colorado River may wish to contact the Colorado River Management Division, Department of Water Resources at (602) 542-1960 to determine those Townships and Ranges which will be affected by these requirements or with questions regarding the proof of right.

VII. Special construction standards required pursuant to A.A.C. Rule R12-15-821: _____

Dear Well Owner:

Enclosed for your records is an annotated copy of the Notice of Intention to Drill a well. This is returned to you as evidence of compliance with A.R.S. §45-596. A drilling card has been mailed to your designated driller. Prior to drilling he must have it in his possession.

Since this well is being drilled as a Monitor well, or for Cathodic Protection, Grounding, Geotechnical or Piezometer purposes, our standard driller report form is also being furnished. He is required to complete it and return it to the Department within 30 days after the installation of the pumping equipment as required by A.R.S. §45-600.

A Change of Well Information form is enclosed for your future use . If you deem it necessary to change the location of the proposed well, please notify the Department on the enclosed form. A properly amended Drilling Card will then be issued and must be in possession of the driller before drilling begins. During the drilling of a new well, if it is determined that it must be abandoned, then a Well Abandonment Completion Report must be submitted per R12-15-816.F. Per A.R.S. §45-593, the person to whom a well is registered shall notify this Department of a change of ownership of the well and/or information pertaining to the physical characteristics of the well, in order to keep the well registration file current and accurate.

For additional information, you may contact the Operations Division at (602) 542-1581.

Sincerely,

Ellen Kane

INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

General Instructions

1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form **in duplicate** with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.

2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.

3. No registration fee is required for Exempt Wells. A $10.00 registration fee must accompany registration forms for all Non-Exempt Wells.

4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.

5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

INSTRUCTIONS FOR REGISTRATION QUESTIONS

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middie initiai. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

NOTICE OF INTENTION TO DRILL WELL

LAND DEPARTMENT
WATER DIVISION
STATE OF ARIZONA

By Law, no person shall drill, or cause to be drilled, any well for the development and use of Ground Water in Arizona without first filing Notice of Intention to Drill with the State Land Department. The only exceptions are for those irrigation wells within critical Ground Water areas for which Drilling Permits are required. No well shall be drilled by other than the owner without the driller being licensed with the Registrar of Contractors. The driller's license number must be included before the State Land Department will process the filing.

COMPLETION REPORT

1. Completion Report to be filed with the Department within 30 days after installation of pump equipment.

2. The tested pumping capacity of the well in gallons per minute for a non-flowing well should be determined by measuring the discharge of the pump after continuous operation for at least 4 hours and for a flowing well by measuring the natural flow at the land surface.

3. Drawdown of the water level for a non-flowing well should be measured in feet after not less than 4 hours of continuous operation and while still in operation and for a flowing well the shut-in pressure should be measured in feet above the land or in pounds per square inch at the land surface.

4. The static groundwater level should be measured in feet from the land surface immediately prior to the well capacity test.

LOCATION OF THE WELL

SW SW SW 11 T24S R24E

Date Well Completed 3-14-81 Depth of Well 300'

1. Well Test:
Test Pumping Capacity 13 G.P.M. Date Well Tested 3-20-81
(Gal. per min.)

Method of Discharge Measurement _____
(weir, orifice, current meter, etc.)

Static Groundwater Level 168 ft. Drawdown 12 ft.
Total Pumping Lift 180 ft. Drawdown _____ lbs.
(Flowing Well)

2. Equipment Installed:

Kind of Pump Submersible
(turbine, centrifugal, etc.)

Kind of Power Elec (Elec., Nat. Gas, Etc.) H.P. Rating of Motor 2 H.P.

I HEREBY CERTIFY that the above statements are true to the best of my knowledge and belief.

APPLICATION GUIDELINES

In accordance with Arizona Revised Statutes ("A.R.S.") §§ 41-1008 and 1079, the Department of Water Resources (Department) provides the following information regarding the application review process for authority to drill.

NECESSARY STEPS & INSTRUCTIONS TO OBTAIN DRILLING AUTHORITY

1. Pursuant to A.R.S. § 45-596, a person may not drill, cause to be drilled, deepen or modify any well for which a permit is not required without first filing a Notice of Intent to Drill with the Department. Only a well drilling contractor licensed in the State of Arizona or a single well licensee (a person licensed to drill or modify one exempt well on his or her own property) is authorized to drill, deepen or modify a well. Drilling may not begin until the well drilling contractor or licensee has possession of a drilling card at the well site, issued by the Director in the name of the well drilling contractor or licensee, and which authorizes the drilling of the specific well in a specific location. To assist you in understanding the requirements for this application, copies of A.R.S. § 45-596 and Arizona Administrative Code ("A.A.C.") R12-15-810 are available at the Department bookstore (602-417-2450 x7127).
2. If replacing, deepening, or modifying an existing well, provide the registration number of the existing well in item 2. A replacement well is one located no more than 660 feet from the original well and that is not expected to annually withdraw more groundwater than historically withdrawn from the original well.
3. Information to complete items 3, 4, 5 and 13 may be available from your driller.
4. Information to complete items 9 and 12 may be available from your County Assessor's Office.
5. For item 10, in an Active Management Area, A.R.S § 45-454 only allows non-irrigation uses for "exempt" wells. If the proposed use includes the growing of 2 or more acres of plants for sale or human/animal consumption (irrigation use), the well does not qualify as an exempt well.
6. An exempt well, referred to in Item 10, means a well with a pump with a maximum capacity of not more than thirty-five gallons per minute and used for non-irrigation purposes.
7. For item 11, in an Active Management Area, A.R.S §45-454 allow up to 56 acre feet per year of pumping from a domestic (residential) or stock watering exempt well, and up to 10 acre ft per year from an exempt well used for other (usually commercial non-irrigation) purposes.
8. If any water from a proposed well on a parcel of twenty or fewer acres will be used for domestic purposes, as defined in § 45-454, the applicant must submit a well site plan of the property. The plan must be on an 8½" x 11" piece of plain paper with representation of the locations of all structures and proximity of adjacent lot lines, to scale. It must include the county assessor's parcel identification number. The plan must show the proposed well location and the location of any septic tank or sewer system that is either located on the property or within one hundred feet of the proposed well site, as well as indicating the measured shortest distance between the proposed well and existing septic tank system. **The plan must demonstrate that the well will not be drilled within one hundred feet of any septic or sewer system.**
9. The site plan must be approved by the county health authority, or by a local health authority in areas where the county health authority has delegated authority to approve septic or sewer systems. Endorsement by the county/local authority is based solely on the best available judgement that the proposed well, as shown on the site plan submitted, is 100 feet or more from all known and visually identifiable sewage treatment systems. It is not a representation that a well placed at this site will be guaranteed as to quantity or quality. In areas where there is no local or county authority that controls installation of septic tanks or sewer systems, or if the health authority is unable to determine whether the proposed well location complies with state and local requirements, the applicant must apply for approval directly to the Department of Water Resources.
10. If an individual other than the land owner or lessee signs this notice, an original letter of authorization from the land owner/lessee, stating that the individual has permission to sign this specific notice on his or her behalf, must accompany the notice.
11. Please mail **two original Notices** with **original signatures** and **two site plans** and, in accordance with A.R.S. § 45-113, a **check or money order (no cash) in the amount of $10.00** to P. O. Box 458, Phoenix Arizona, 85001-0458, or hand deliver to 500 North Third Street, Phoenix, Arizona.
12. Arizona Revised Statute § 45-596(D) provides that the Director of the Department is to determine whether or not all information required on this form has been submitted. If not, the person filing the Notice will be notified, and the drilling or modification of the well may **not** proceed.
13. This form is not applicable for non-exempt wells (those yielding more than thirty-five gallons per minute) within an Active Management Area. Contact Groundwater Management for further information regarding the appropriate notice to file with the Department.

TIME FRAME FOR REVIEW OF YOUR APPLICATION

Within 15 days after receipt of your Notice of Intention the Arizona Department of Water Resources ("Department") will determine whether your application should be granted or denied, unless this time is extended for lack of a complete application. If your application is incomplete, the Department will notify you in writing and will specify what information is necessary to make the application complete. Until the missing information is received, the time frame for review of your application will be suspended. Your application will not be complete until all of the requested information is received. If you do not supply the missing information within sixty (60) days, the Department may deem your application withdrawn and close the file.

At the end of its review, the Department will send you a written notice either granting or denying your application for drilling authority. If your application is approved, the Drill Card will be mailed directly to the drilling contractor. If denied, the Department's notice will state justification for the denial and an explanation of your right to appeal.

CONSTRUCTION AND FOLLOW UP REQUIREMENTS

1. Construction and abandonment standards for wells, must be in accordance with Department Regulations. A.R.S. § 45-594 and Arizona Administrative Code R12-15-811 require the well to be constructed with a twenty foot steel surface seal casing, including a one foot steel stickup and one and one-half inches of grout seal around the casing from the surface to a depth of twenty feet, unless a variance is granted **(see A.R.S. § 45-596 (G) for procedure to follow in requesting a variance).**
2. Pursuant to § 45-596(E), the drilling, deepening or modification of the well must be completed within one year of the date of the Notice of Intent. If the well is not completed within one year, a new Notice of Intent must be filed before proceeding with further construction.
3. If a well which was originally drilled as an exploration well, a monitor well, a piezometer well or for any use other than domestic use is later proposed to be converted to use for domestic purposes as defined in § 45-454, the well owner must file a Notice of Intention to Drill and comply with the requirements of § 45-596 before the well is converted and any water from that well is used for domestic purposes.
4. Within thirty days after installation of pumping equipment, the registered well owner must file a Completion Report with the Department. The person to whom a well is registered also must notify the Department of a change in ownership or a change in data relating to this well.

Director

ARIZONA WATER COMPANY
PO BOX 29006
PHOENIX, AZ 85038

Registration No. 55- 590620
File No. D(24-23) 13 ABD

Dear Well Owner:

Enclosed is a copy of the Notice of Intention (NOI) to Drill a well. This NOI, which was recently filed with this Department, is being returned to you as evidence of your compliance with ARS §45-596. The enclosed Completion Report is to be submitted when pump equipment is installed. The Drilling Card and Well Drilling Report form have been sent to your driller. He may not begin drilling until he has received the Drilling Card and it must be displayed on the rig during drilling. If you change drillers, you must supply this Department with the new driller's identity. Please ensure that the driller you select is licensed to drill the type of well you require. All well drillers must pass an examination proving they understand the drilling methods for that particular license, and are familiar with the laws and regulations which govern well construction in Arizona.

If it is necessary to change the location of the proposed well, immediately contact the Department of Water Resources to obtain written permission before proceeding with the drilling. A properly signed, amended Drilling Card must be in the possession of the driller before drilling commences at a different location than originally authorized.

ARS §45-600 requires the registered well owner to submit a completion report within thirty (30) days after the installation of pumping equipment. It also requires the driller to furnish this Department a complete and accurate log of the well within thirty (30) days after completion of drilling. You should insist, and ensure, that both of these are done.

If in the course of drilling a new well, it is determined that the new well cannot be successfully completed as initially intended (dry hole, cave in, lost tools, etc.), the new well must be properly abandoned and a Well Abandonment Completion Report submitted per R12-15-816.F.

Per ARS §45-593 (C), the person to whom a well is registered shall notify this Department of a change in ownership of the well and/or information pertaining to the physical characteristics of the well in order to keep this well registration file current and accurate. We have enclosed a Change of Well Information Form should it be needed in the future.

Sincerely,

Toni Bergeman

INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

General Instructions

1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form **in duplicate** with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.

2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.

3. No registration fee is required for Exempt Wells. A $10.00 registration fee must accompany registration forms for all Non-Exempt Wells.

4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.

5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

INSTRUCTIONS FOR REGISTRATION QUESTIONS

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

3. No registration fee is required for Exempt Wells. A $10.00 registration fee must accompany registration forms for all Non-Exempt Wells.

4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.

5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

INSTRUCTIONS FOR REGISTRATION QUESTIONS

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

General Instructions

1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form **in duplicate** with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.

2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.

3. No registration fee is required for Exempt Wells. A $10.00 registration fee must accompany registration forms for all Non-Exempt Wells.

4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.

5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

INSTRUCTIONS FOR REGISTRATION QUESTIONS

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

General Instructions

1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form **in duplicate** with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.

2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.

3. No registration fee is required for Exempt Wells. A $10.00 registration fee must accompany registration forms for all Non-Exempt Wells.

4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.

5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

INSTRUCTIONS FOR REGISTRATION QUESTIONS

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

INSTRUCTIONS FOR COMPLETING REGISTRATION FORM

General Instructions

1. A person who owns an "Existing Well" shall register the well, pursuant to A.R.S. 45-593, by filing this form **in duplicate** with the Department of Water Resources not later than midnight June 14, 1982. The form must be completed and signed. Failure to do so will constitute a violation of A.R.S. 45-593, and may subject the well owner to injunction and/or civil penalties, pursuant to A.R.S. Title 45, Article 12.

2. An "Existing Well" means, (1) a well which was drilled on or before June 12, 1980 and which is not abandoned or sealed, or (2) a well which was not completed on or before June 12, 1980, but for which a Notice of Intention to Drill was on file with the Arizona Water Commission on or before June 12, 1980.

3. No registration fee is required for Exempt Wells. A $10.00 registration fee must accompany registration forms for all Non-Exempt Wells.

4. An "Exempt Well" means a well having a pump with a maximum capacity of not more than 35 gallons per minute which is used to withdraw groundwater. An Exempt Well may include the non-commercial irrigation of not more than 1 acre of land.

5. A "Non-Exempt Well" means a well that is not an "Exempt Well".

INSTRUCTIONS FOR REGISTRATION QUESTIONS

1. The Registrant must be the owner of the well and may be an individual, public or private corporation, company, partnership, firm, association, society, estate, trust, any other private organization or enterprise, the United States, any state, territory or country or a governmental entity, political subdivision or municipal corporation organized under or subject to the constitution and laws of this State.

2. If you own an existing irrigation well drilled at any time, or any other type of well drilled on or after June 20, 1968, you should have an assigned control and/or file number. Write these numbers in item 2. If you do not know the number, please explain the reason on the form or on an attached sheet.

3. a. Fill in the Section, Township and Range in all cases if it is available.
   b. If the well is in a subdivision and you have this information, give the subdivision name, Lot Number, and Address.

4. Show all purposes for which the water is used.

5. If the well is used for irrigation, give the number of acres irrigated in 1980 from the well.

6. If the owner of the land is an individual, give the last name, first name, middle initial. If the owner of the land is a corporation, partnership, firm, etc., fill in the appropriate title.

7. Complete the section on Well Data with the most accurate information available to you. If the data is not available, write N/A in the blanks.

8. Give the legal description of the place of use of the water. If place of use is in a subdivision and legal description is not available, give the subdivision name, Lot Number and/or address on the blank line.

9. The person in whose name a well is registered shall notify the Department of any change in ownership and shall keep all information on the registration record current and accurate. A form entitled "Change of Well Information/Ownership" is available for this purpose. A blank form will be furnished with the returned duplicate copy of the registration form.

Registration No. 55-214612
File No. D(23-23) 36 DBB

Dear Well Owner:

Enclosed is a copy of the Notice of Intention (NOI) to Drill a well that you recently filed with this Department pursuant to A.R.S. § 45-596. This is to inform you that the Department has approved the NOI and has mailed or otherwise provided a drilling card authorizing the drilling of the well to the well driller identified in the NOI. The driller may not begin drilling until he has received the drilling card, which must be displayed on the drill rig during drilling.

Well drilling activities must be completed within one year after the date the NOI was filed with the Department. If drilling is not completed within one year, you must file a new NOI before proceeding with further drilling. If in the course of drilling the well, it is determined that the well cannot be successfully completed as initially intended (dry hole, cave in, lost tools, etc.), the well must be properly abandoned and a Well Abandonment Completion Report must be filed as required by A.A.C. R12-15-816(F).

If you change drillers, you must notify the Department of the new driller's identity. Please ensure that the new driller is licensed by the Department to drill the type of well you require. A new driller may not begin drilling until he receives a new drilling card from the Department. If you are drilling a new or replacement well and it is necessary to change the location of the proposed well, you may not proceed with drilling until you file an amended NOI with the Department and the Department issues an amended drilling card to the driller. If county approval was required for the original well site plan (this applies to domestic wells on parcels that are five acres or less), you must submit a new well site plan with the new well location to your local county health authority for approval prior to filing the amended NOI with the Department.

A.R.S. § 45-600 requires the registered well owner to complete and file a Pump Installation Completion Report form (DWR form 55-56) within 30 days after the installation of pumping equipment. A form is enclosed for your use. Also enclosed is a well owner's guide that provides useful information and advice concerning your upcoming well construction project. A.R.S.§ 45-600 also requires the driller to file a complete and accurate Well Drillers Report and Well Log (DWR form 55-55) within 30 days after completion of drilling. That form was mailed to your driller with the drilling card. You should insist and ensure that all of the required forms are accurately completed and timely filed with the Department.

Please be advised that A.R.S. § 45-593(C) requires the person to whom a well is registered to notify the Department of a change in ownership of the well and/or information pertaining to the physical characteristics of the well in order to keep this well registration file current and accurate. Any change in well information or a request to change well driller must be filed on a Request to Change Well Information form (DWR form 55-71A) that may be downloaded from the ADWR Internet website at <http://www.water.az.gov/adwr/content/forms/default.htm#NOI>.

Sincerely,

Monica Phillips

Notice of Intent to Drill, Deepen, Replace or Modify a Well
(except a Non-Exempt Well in an Active Management Area)

$150 or $100 FEE

PAID 2-17-07 REC # 3889911

- Review instructions prior to completing form in black or blue ink.
- You must include with your Notice:
- Check or money order in the amount of the appropriate filing fee. For a well located within an AMA or INA, the fee is $150.00. For a well not located within an AMA or INA, the fee is $100.00 if the well will be used solely for domestic purposes (see page 2 and instructions) and will have a pump with a maximum capacity of not more than 35 gallons per minute. Otherwise, the fee is $150.00.
- Authority for fee: A.R.S. § 45-596.

* ADWR well construction standards require a surface seal consisting of a minimum of 20 feet of steel casing. Cement grout must be used to fill the annular space between the surface casing and the borehole. (A.A.C. R12-15-811(B))

The Department's issuance of an authorization to drill a well is not a determination of whether water withdrawn from the well is legally surface water or groundwater. The legal nature of the water withdrawn from the well may be the subject of court action in the future as part of a determination of surface water rights in your area. If there are court proceedings that could affect your well, you will be notified and be given the opportunity to participate. If you have questions regarding the legal nature of the water to be withdrawn from your proposed well, please consult with an experienced civil engineer, hydrologist or water rights attorney.

For the purposes of determining appropriate fees outside AMAs or INAs, "domestic purposes" is defined as "uses related to the supply, service and activities of households and private residences and includes the application of water to less than 2 acres of land to produce plants or parts of plants for sale or human consumption, or for use as feed for livestock, range livestock or poultry, as such terms are defined in A.R.S. § 3-1201."

I state that this notice is filed in compliance with A.R.S. § 45-596 and is complete and correct to the best of my knowledge and belief.

Re: Well Registry Number: 55-214612
File (Location) Number: D (23-23) 36 DBB

Dear Applicant:

The Department of Water Resources recently received your Notice of Intent (NOI) to Drill, Deepen, Replace or Modify a Well. However, our review indicates that the NOI is incomplete under the Groundwater Management Act for the following reason(s):

- **YOUR APPLICATION WAS SUBMITTED WITHOUT YOUR ORIGINAL SIGNATURE. PLEASE SIGN THE SECOND PAGE JUST BELOW SECTION 7 AND RETURN ALL COPIES. WE DO NOT ACCEPT COPIED OR FAXED SIGNATURES.**

PLEASE CALL MONICA PHILLIPS AT 602-771-8641 WITH ANY QUESTIONS.

In accordance with Arizona Revised Statutes (A.R.S.) § 45-596, Paragraph D, the Department is mailing this "statement of determination" as a request for information necessary to make the NOI complete and correct. Please provide the Department with the additional information and resubmit the corrected NOI form and any attachments (if applicable) to ADWR. The Department's substantive review time frame is suspended until all requested information is provided. If the Department does not receive the necessary information within sixty (60) days, the application may be denied. You would then have to re-initiate the NOI process and pay a new filing fee to receive a drilling authority for this location.

ATTACH THIS NOTICE WHEN RESUBMITTING THE COMPLETED NOI AND RETURN TO:

0	20'	6 5/8"	X*										Cement
20	160	6 5/8"		X									
160	200	6 5/8"		X									

* ADWR well construction standards require a surface seal consisting of a minimum of 20 feet of steel casing. Cement grout must be used to fill the annular space between the surface casing and the borehole. (A.A.C. R12-15-811(B))

The Department's issuance of an authorization to drill a well is not a determination of whether water withdrawn from the well is legally surface water or groundwater. The legal nature of the water withdrawn from the well may be the subject of court action in the future as part of a determination of surface water rights in your area. If there are court proceedings that could affect your well, you will be notified and be given the opportunity to participate. If you have questions regarding the legal nature of the water to be withdrawn from your proposed well, please consult with an experienced civil engineer, hydrologist or water rights attorney.

For the purposes of determining appropriate fees outside AMAs or INAs, "domestic purposes" is defined as "uses related to the supply, service and activities of households and private residences and includes the application of water to less than 2 acres of land to produce plants or parts of plants for sale or human consumption, or for use as feed for livestock, range livestock or poultry, as such terms are defined in A.R.S. § 3-1201."

I state that this notice is filed in compliance with A.R.S. § 45-596 and is complete and correct to the best of my knowledge and belief.

Re: NOI to Drill 55-205126

Dear Applicant:

Enclosed please find a refund check in the amount of seventy-five dollars ($75.00). The Department is refunding a portion of the NOI filing fees because of overpayment on your part. The appropriate filing fee for a well not located within an AMA or INA, is $75 if the well will be used solely for domestic purposes and will have a pump with a maximum capacity of not more than 35 gallons per minute.

If you have any questions about the refund, please contact Jeannie Aguilar of the Water Management Support Section at 602-417-2470.

Sincerely,

Jeannie Aguilar

Registration No. 55- 205126
File No. D(24-24) 18 CBB

Dear Well Owner:

Enclosed is a copy of the Notice of Intention (NOI) to Drill a well that you recently filed with this Department pursuant to A.R.S. § 45-596. This is to inform you that the Department has approved the NOI and has mailed or otherwise provided a drilling card authorizing the drilling of the well to the well driller identified in the NOI. The driller may not begin drilling until he has received the drilling card, which must be displayed on the drill rig during drilling.

Well drilling activities must be completed within one year after the date the NOI was filed with the Department. If drilling is not completed within one year, you must file a new NOI before proceeding with further drilling. If in the course of drilling the well, it is determined that the well cannot be successfully completed as initially intended (dry hole, cave in, lost tools, etc.), the well must be properly abandoned and a Well Abandonment Completion Report must be filed as required by A.A.C. R12-15-816(F).

If you change drillers, you must notify the Department of the new driller's identity. Please ensure that the new driller is licensed by the Department to drill the type of well you require. A new driller may not begin drilling until he receives a new drilling card from the Department. If you are drilling a new or replacement well and it is necessary to change the location of the proposed well, you may not proceed with drilling until you file an amended NOI with the Department and the Department issues an amended drilling card to the driller. If county approval was required for the original well site plan (this applies to domestic wells on parcels that are five acres or less), you must submit a new well site plan with the new well location to your local county health authority for approval prior to filing the amended NOI with the Department.

A.R.S. § 45-600 requires the registered well owner to complete and file a Pump Installation Completion Report form (DWR form 55-56) within 30 days after the installation of pumping equipment. A form is enclosed for your use. Also enclosed is a well owner's guide that provides useful information and advice concerning your upcoming well construction project. A.R.S.§ 45-600 also requires the driller to file a complete and accurate Well Drillers Report and Well Log (DWR form 55-55) within 30 days after completion of drilling. That form was mailed to your driller with the drilling card. You should insist and ensure that all of the required forms are accurately completed and timely filed with the Department.

Please be advised that A.R.S. § 45-593(C) requires the person to whom a well is registered to notify the Department of a change in ownership of the well and/or information pertaining to the physical characteristics of the well in order to keep this well registration file current and accurate. Any change in well information or a request to change well driller must be filed on a Request to Change Well Information form (DWR form 55-71A) that may be downloaded from the ADWR Internet website at <http://www.water.az.gov/adwr/content/forms/default.htm#NOI>.

Sincerely,

Jeannie Aguilar

STEFFEN, ROBERTSON AND KIRSTEN (SRK) (1997) REPORT ON AQUIFER TESTS BY ERROL L. MONTGOMERY AND ASSOCIATES CONDUCTED IN 1989

Calculated By: C.Er Date: 7/8/97
Checked By: [illegible] Date: 7/8/97

CALCULATION BRIEF FOR GROUNDWATER FLOW AND TRANSPORT MODEL INPUT PARAMETERS AQUIFER TEST ANALYSIS

PURPOSE

This calculation brief was prepared to document the estimation of hydraulic conductivity values from aquifer test data collected in the Phelps Dodge Copper Queen Concentrator Tailing Storage Area (CTSA) in Bisbee, Arizona. The estimated hydraulic conductivity values are used in the groundwater flow model for the CTSA. This calculation brief provides background site information, methodology and analysis results.

BACKGROUND

The groundwater flow model includes estimates of the hydraulic conductivity for each layer specified in the model. Site-specific hydraulic conductivity values are typically obtained from analyses of aquifer test data by an appropriate analytical method.

The principal hydrogeological units of interest (e.g., contain the uppermost groundwater aquifer) at this site are Basin-Fill Deposits and Morita Formation. The groundwater model includes these units within the CTSA area. The aquifer tests were designed to obtain the hydraulic properties of these units. Aquifer testing was conducted by Errol Montgomery Associates (Montgomery) in 1989 at the following well locations:

- TM-1, TM-11 and TM-13: Completed in Basin-Fill Deposits;
- TM-16, TM-19A and TM-30: Completed in Morita Formation; and
- TM-1A, TM-29, TM-29A, and TM-29B: Completed in Basin-Fill Deposits and Morita Formation.

The location of these wells are presented in Figure 1. The well completion diagrams are included in Attachment A.

Aquifer test data were analyzed by Montgomery and are presented in the report titled "Subsurface Geology and Groundwater Hydrology Section for Phelps Dodge: Aquifer Protection Permit Application" (1990) (Attachment B).

SRK conducted an independent analysis of this aquifer test data for comparison to the Montgomery results (Table 1). The purpose of the comparison was to determine the most accurate hydraulic property values for model input. A description of methods (i.e., analytical solutions) used by SRK in the independent analysis and the corresponding results are included in Attachment C.

METHODOLOGY

A typical aquifer test involves pumping at least one well and measuring the water levels at one or more observation wells. In this case, several aquifer tests did not have corresponding drawdown readings from observation wells, therefore, drawdown in the pumping well was utilized as the observation well drawdown. To calculate the hydraulic conductivity and storage, the distance from pumping well to the observation well is considered equal to the radius of the pumping well. As a result, the radius of the well is large compared to the distance to the observation well and the pumping well should be treated as a large diameter well. This approach does not consider the well losses and turbulent flow, therefore, estimates of hydraulic conductivity and storage are likely lower than actual conditions.

The aquifer test data utilizing pumping well drawdown was analyzed by Montgomery using log-log or semi-log plots of drawdown versus time which typically generates a straight line (Attachment B). The transmissivity and storage coefficient of the aquifer can be calculated based on the slope of the straight line.

The log-log and semi-log plot methods were primarily developed for analyses of aquifer data from a confined aquifer system. However, when drawdown is less than half of the thickness of the aquifer, these plots may also be used for unconfined aquifer systems (Bouwer, 1978; page 76 and 107). The data obtained by these plots have some limitations. For example, these plots assume full well penetration into the aquifer, no delayed gravity yield and no well storage which increases the uncertainty of the data from log-log or semi-log plots.

When available, SRK utilized the drawdown data from these observation wells to obtain more accurate estimates of hydraulic properties of the aquifer. The technical approach used by SRK consisted of digitizing existing time-drawdown data from log-log graphs of

the 1989 aquifer tests. The aquifer test data was subsequently analyzed by the AQTESOLV computer program developed by Geraghty and Miller. AQTESOLV is designed to allow multiple analyses of aquifer test data for selection of the most appropriate analytical solution based on the shape of the drawdown curve, physical characteristics of the aquifer, well construction details and pumping rates. The partial well penetration, well storage effects and delayed gravity yield effects were considered by AQTESOLV whenever applicable. AQTESOLV contains the following analytical solutions which were utilized by SRK as appropriate:

ANALYTICAL SOLUTION	TYPE OF AQUIFER			
	Confined	Leaky	Unconfined	Fractured
Bouwer-Rice (slug)			X	
Cooper-Bredehoeft-Papadopulos (slug)	X			
Copper-Jacob	X		X	
Hantush		X		
Moench		X		X
Neuman			X	
Papadopulos-Cooper	X			
Theis	X		X	
Theis Recovery	X			

The aquifer tests conducted on pumping wells TM-11, TM-13, and TM-16 lacked corresponding drawdown data from observation wells. Therefore, for these wells, pumping wells were treated as observation wells. Aquifer tests conducted at the pumping wells TM-1, TM-29, and TM-30 included drawdown data from several observation wells, (i.e., TM-1A, TM-29A, TM-29B and TM-19A). For these tests, the observation well data were used to estimate the aquifer properties.

RESULTS

The aquifer test analyses results obtained for the Basin Fill Deposits and Morita formations are presented in the following sections:

Basin Fill Deposit Tests:

Three basin fill wells, TM-1, TM-11 and TM-13 were subject to aquifer testing. TM-11 and TM-13 aquifer test data lacked corresponding observation well drawdown data; as a result, the drawdown in these wells was used to estimate the aquifer properties. TM-11

and TM-13 were pumped at 15 and 32 gallons per minute (gpm), respectively. The maximum drawdown was 17.63 feet (ft) in TM-11 and 4.15 ft in TM-13 with corresponding specific capacities of 0.9 and 7.7 gpm/ft, respectively. These values indicate that the Basin Fill Deposit is permeable and has a high storage capacity. The Montgomery analyses indicated that the hydraulic conductivity values were 39 ft/day [12 meters/day (m/day)] for TM-11 and 59 ft/day (18 m/day) for TM-13 (Table 1 and Attachment B).

Well completion diagrams for TM-11 and TM-13 indicate that these wells are partially penetrating the Basin Fill Deposits (Attachment A). As a result, partial penetration effects should be included in the analyses of the pumping tests. As shown in the drawdown versus time graphs presented in Attachment C, the data exhibits a delayed yield from gravity drainage. Unfortunately, the methods developed for analyzing delayed yield (i.e. Neuman Method) cannot account for borehole effects from large-diameter wells. Any attempt to use this method will result in unrealistic estimates of storage coefficient (>1.0). Therefore, SRK used the Hantush-Jacob method developed for analyzing a leaky aquifer to account for the partial penetration and delayed gravity yield.

The aquifer test results simulated by SRK and the previous test results from Montgomery are presented in Table 1. In comparison to the Montgomery results, the hydraulic conductivity values based on the Hantush Jacob leaky aquifer method are lower for both TM-11 and TM-13. The hydraulic conductivity values obtained by SRK were 1.2 ft/day (0.37 m/day) for TM-11 and 19.1 ft/day (5.8 m/day) for TM-13.

TM-1 is a fully penetrating well completed in the Basin Fill Deposit. While pumping TM-1, drawdown was measured at observation wells TM-1A which was completed in both Basin Fill and Morita Formations. To determine the most appropriate hydraulic conductivity value for the pump test data for TM-1, Method 1, Specific Capacity Equation and Method 2, AQTESOLV were compared. The details of these two methods and corresponding results follow.

Method 1: Specific Capacity Equation

Transmissivity is obtained from specific capacity equation:

$$Q/s = T/1500$$

where,

Q/s: Specific capacity of the fully penetrating pumping well in gallons per minute/foot (gpm/ft)

s: Drawdown in the well, in feet

T: Transmissivity, in gallons per day/foot (gpd/ft)

Q/s= 20/9.1 =2.2 gpm/ft

so,

T = 2.2 X 1500= 3,300 gpd/ft =442.2 ft^2/day

Saturated Thickness = 41 ft

Therefore,

hydraulic conductivity is

K= T / Saturated Thickness = 442.2 /41 =10.8 ft/day = 3.3 m/day

Method 2: AQTESOLV Method

The results of AQTESOLV by the Leaky Moench Method are presented in Attachment C.

The analysis yield a transmissivity (T) value of 0.32 ft^2/min= 461 ft^2/day.

From this value, hydraulic conductivity (K) could be calculated as,

K= T / Thickness = 461/41= 11 ft/day = 3.4 m/day

The analyses of the data by both methods provided comparable results, however, the hydraulic conductivity values are smaller than the values obtained by Montgomery (Table 1).

Morita Formation Tests:

Pump tests were conducted for well TM-30 and the drawdown was recorded for observation well TM-19A. Pump tests were also conducted for well TM-29 and the drawdown was recorded for observation wells TM-29A and TM-29B. Although TM-29A and TM-29B were completed in both Basin Fill and Morita formations, the drawdown data from these observation wells were utilized to estimate the hydraulic properties of the

Morita Formation. Drawdown from TM-29A and TM-29B was assumed to be most representative of the Morita Formation due to the limited saturation of the Basin Fill. A description of methods and associated results from the aquifer tests at the above wells are presented in Attachment C.

Analyses of drawdown from TM-19A was completed by using the Leaky Hantush Method. The estimated transmissivity (T) was approximately 1,167 ft^2/day. Since the formation thickness at this well location is approximately 200 feet, hydraulic conductivity (K) =T/200 =1167/200= 5.8 ft/day =1.8 m/day (Table 1).

Drawdown data for observation wells TM-29A and TM-29B fit the Moench Fracture-Slab Model. This model assumes horizontal flow through fractures separated by blocks of porous rock within a confined aquifer. Flow through the porous blocks is vertical and is derived from storage within the blocks. The results indicate that hydraulic conductivity is 1.3 ft/day (0.4 m/day) for TM-29A and 1.75 ft/day (0.5 m/day)for TM-29B.

The analyses of pump test data from TM-16 by the Pappadopulos-Cooper Method indicate that transmissivity (T) is 0.15 ft^2/min=216 ft^2/day. The approximate thickness=100 feet and as a result, hydraulic conductivity (K) = T/Thickness = 216/100 = 2.16 ft/day = 0.65 m/day (Table 1).

ASSUMPTIONS

The assumptions for AQTESOLV methods that were used to analyze the aquifer test data are included in Attachment C.

CONCLUSIONS

The results of the SRK independent analyses of the pumping test data indicate that the lack of drawdown data from observation wells in the Basin Fill Deposits placed constraints on selecting the most appropriate analytical method. SRK found it necessary to analyze the aquifer data by numerous AQTESOLV methods due to the variety of aquifer conditions and the lack of observation well data. Therefore, the hydraulic conductivity values obtained by SRK for the Basin Fill Deposits were lower than the results obtained by Montgomery.

Aquifer tests conducted on Morita Formation wells had sufficient observation well data and therefore, the results obtained by SRK and Montgomery are more comparable.

As indicated on Table 1, the average hydraulic conductivity values obtained by SRK are 10.4 ft/day(3.2 m/day) for the Basin Fill (i.e., wells TM-11 and TM-30), 5.8 ft/day (1.8 m/day) for the Morita Formation west of the fault (i.e., well TM-30) and 1.6 ft/day (0.5 m/day) for the Morita Formation east of the fault (i.e., TM-16 and TM-29). These results indicate that the Basin Fill deposits appear to be more permeable than the Morita Formation. Also, within the CTSA, the Morita Formation is less permeable on the east side of the fault than on the west. The summary and the comparisons of the hydraulic conductivity values are presented in Table 1.

The hydraulic conductivity values from Table 1 were utilized to calibrate the groundwater flow model developed for the CTSA. During model calibration, adjustments to these values were made to match the model simulated groundwater levels to the field-measured levels. The hydraulic conductivity values for the calibrated model were as follows:

Basin Fill:	9.8 ft/day (3.0 m/day)
Morita Formation - West of the Fault:	4.6 ft/day (1.4 m/day)
Morita Formation - East of the Fault:	0.03 ft/day (0.01 m/day).

ANALYTICAL SOLUTIONS

LIST OF SYMBOLS AND ABBREVIATIONS

Symbol or Abbreviation	Definition
b	thickness of aquifer [L]
K, K_r	horizontal hydraulic conductivity of aquifer [L/T]
K_z	vertical hydraulic conductivity of aquifer [L/T]
Q	well pumping rate [L^3/T]
r	radial distance from pumping well to observation well [L]
r_c	well casing radius [L]
r_w	wellbore radius [L]
s	water level displacement or drawdown [L]
S	storage coefficient of aquifer [dimensionless]
S_y	specific yield of aquifer [dimensionless]
t	time since pumping began [T]
T	transmissivity of aquifer [L^2/T]

UNSTEADY FLOW TO A LARGE-DIAMETER WELL IN A CONFINED AQUIFER

REFERENCE:

Papadopulos, I.S. and H.H. Cooper, 1973. Drawdown in a well of large diameter, Water Resources Research, vol. 3, pp. 241-244.

ASSUMPTIONS:

aquifer has infinite areal extent
aquifer is homogeneous, isotropic and of uniform thickness
aquifer potentiometric surface is initially horizontal
pumping well is fully penetrating
flow to pumping well is horizontal
aquifer is confined
flow is unsteady
water is released instantaneously from storage with decline of hydraulic head

SOLUTION:

$$s = \frac{Q}{4\pi T} F(u, \alpha, \frac{r}{r_w})$$

where:

$$F = \frac{8\alpha}{\pi} \int_0^\infty \frac{\left[(1 - e^{-\beta^2\rho^2/4u})\right] J_0(\beta\rho) A(\beta) - Y_0(\beta\rho) B(\beta)\right]}{\left\{[A(\beta)]^2 - [B(\beta)]^2\right\}\beta^2} d\beta$$

$$A(\beta) = \beta\ Y_0(\beta) - 2\alpha\ Y_1(\beta)$$

$$B(\beta) = \beta\ J_0(\beta) - 2\alpha\ J_1(\beta)$$

$$u = \frac{r^2 S}{4Tt}$$

$$\alpha = \frac{r_w^2 S}{r_c^2}$$

β = variable of integration

$$\rho = \frac{r}{r_w}$$

J_0 = zero order Bessel function of the first kind
J_1 = first order Bessel function of the first kind
Y_0 = zero order Bessel function of the second kind
Y_1 = first order Bessel function of the second kind

UNSTEADY FLOW TO A WELL IN A LEAKY AQUIFER WITH NO STORAGE IN AQUITARDS

REFERENCE:

Hantush, M.S. and C.E. Jacob, 1955. Non-steady radial flow in an infinite leaky aquifer, Am. Geophys. Union Trans., vol. 36, pp. 95-100.

ASSUMPTIONS:

aquifer has infinite areal extent
aquifer is homogeneous, isotropic and of uniform thickness
aquifer potentiometric surface is initially horizontal
pumping well is ~~fully~~ penetrating
flow to pumping well is horizontal
aquifer is leaky
flow is unsteady
water is released instantaneously from storage with decline of hydraulic head
diameter of pumping well is very small so that storage in the well can be neglected
confining bed(s) has infinite areal extent, uniform vertical hydraulic conductivity and uniform thickness
confining bed(s) is overlain or underlain by an infinite constant-head plane source
flow in the aquitard(s) is vertical

SOLUTION:

$$s = \frac{Q}{4\pi T} w(u, r/B)$$

where:

w(u,r/B) = Hantush well function = $\int_u^\infty \frac{e^{-y - r^2/4B^2 y}}{y} dy$

$$u = \frac{r^2 S}{4Tt}$$

$$B = \sqrt{\frac{Tb'}{K'}}$$

b' = thickness of aquitard [L]
K' = vertical hydraulic conductivity of aquitard [L/T]

PARTIAL PENETRATION CORRECTION FOR PIEZOMETERS AND OBSERVATION WELLS IN A LEAKY AQUIFER

REFERENCE:

Hantush, M.S., 1961. Drawdown around a partially penetrating well, Jour. of the Hyd. Div., Proc. of the Am. Soc. of Civil Eng., vol. 87, no. HY4, pp. 83-98.

Hantush, M.S., 1961. Aquifer tests on partially penetrating wells, Jour. of the Hyd. Div., Proc. of the Am. Soc. of Civil Eng., vol. 87, no. HY5, pp. 171-194.

ASSUMPTIONS:

The assumptions for the Hantush-Jacob (1955) and Hantush (1960) solutions for leaky aquifers apply.

SOLUTION:

Partial penetration correction for a piezometer:

$$s = \frac{Q}{4\pi T}\left(w(u, r/B) + \frac{2b}{\pi(l-d)} \sum_{n=1}^{\infty} \frac{1}{n} [\sin(\frac{n\pi l}{b}) - \sin(\frac{n\pi d}{b})] \cdot \cos(\frac{n\pi z}{b}) \cdot w(u, \sqrt{(r/B)^2 + \frac{K_z}{K_r}\left(\frac{n\pi r}{b}\right)^2}) \right)$$

Partial penetration correction for an observation well:

$$s = \frac{Q}{4\pi T}\left(w(u, r/B) + \frac{2b^2}{\pi^2(l-d)(l'-d')} \sum_{n=1}^{\infty} \frac{1}{n^2} [\sin(\frac{n\pi l}{b}) - \sin(\frac{n\pi d}{b})] \cdot [\sin(\frac{n\pi l'}{b}) - \sin(\frac{n\pi d'}{b})] \cdot w(u, \sqrt{(r/B)^2 + \frac{K_z}{K_r}\left(\frac{n\pi r}{b}\right)^2}) \right)$$

where:

w(u,r/B) = Hantush well function

$B = \sqrt{\frac{Tb'}{K'}}$ [L]

b' = thickness of aquitard [L]

K' = vertical hydraulic conductivity of aquitard [L/T]

d = distance from top of aquifer to top of pumping well screen [L]

l = distance from top of aquifer to bottom of pumping well screen [L]

z = distance from top of aquifer to piezometer setting [L]

d' = distance from top of aquifer to top of observation well screen [L]

l' = distance from top of aquifer to bottom of observation well screen [L]

UNSTEADY FLOW TO A WELL IN A LEAKY AQUIFER WITH STORATIVE SEMICONFINING LAYERS

REFERENCE:

Moench, A.F., 1985. Transient flow to a large-diameter well in an aquifer with storative semiconfining layers, Water Resources Research, vol. 21, no. 8, pp. 1121-1131.

ASSUMPTIONS:

aquifer has infinite areal extent
aquifer is homogeneous, isotropic and of uniform thickness
aquifer potentiometric surface is initially horizontal
pumping well is fully penetrating
flow to pumping well is horizontal
aquifer is leaky
flow is unsteady
water is released instantaneously from storage with decline of hydraulic head
diameter of pumping well is very small so that storage in the well can be neglected
confining bed(s) has infinite areal extent, uniform vertical hydraulic conductivity and storage coefficient, and uniform thickness
confining bed(s) is overlain or underlain by an infinite constant-head plane source
flow in the aquitard(s) is vertical

SOLUTION:

The Laplace transform solution for drawdown in the pumped well is as follows:

$$\bar{h}_{wD} = \frac{2[K^0(x) + xS_w K_1(x)]}{p\{pW_D[K_0(x) + xS_w K_1(x)] + xK_1(x)\}}$$

The Laplace transform solution for drawdown in an observation well is as follows:

$$\bar{h}_D = \frac{2K^0(r_D x)}{p\{pW_D[K_0(x) + xS_w K_1(x)] + xK_1(x)\}}$$

where:

p = Laplace transform variable

$$x = (p + \bar{q}_D)^{1/2}$$

$$\bar{q}_D = \gamma^2 m \tanh(m)$$

$$m = \frac{(\sigma p)^{1/2}}{\gamma}$$

$$\gamma = r_w\left(\frac{K'}{Kbb'}\right)^{1/2}$$

$$\sigma = \frac{S'_s b'}{S_s b}$$

b = thickness of aquifer [L]

b' = thickness of aquitard [L]

$$r_D = \frac{r}{r_w}$$

K = hydraulic conductivity of aquifer [L]
K' = hydraulic conductivity of aquitard [L]
S_s = specific storage of aquifer [L]
S_s' = specific storage of aquitard [L]
S_w = wellbore skin [dimensionless]

$$W_D = \frac{\pi t_c^2}{2\pi r_w^2 S_s b} \quad \text{[dimensionless]}$$

K_0 = modified Bessel function of second kind, zero order
K_1 = modified Bessel function of second kind, first order

UNSTEADY FLOW TO A WELL IN A FRACTURED AQUIFER WITH SLAB-SHAPED BLOCKS AND FRACTURE SKIN

REFERENCE:

Moench, A.F., 1984. Double-porosity models for a fissured groundwater reservoir with fracture skin, Water Resources Research, vol. 20, no. 7, pp. 831-846.

ASSUMPTIONS:

- aquifer has infinite areal extent
- aquifer has uniform thickness
- aquifer potentiometric surface is initially horizontal
- pumping and observation wells are fully penetrating
- fractured aquifer represented by double porosity system consisting of low-permeability, primary porosity blocks and high-permeability, secondary porosity fissures
- matrix consists of slab-shaped blocks
- flow is unsteady
- water is released instantaneously from storage with decline of hydraulic head

SOLUTION:

The Laplace transform solution for dimensionless drawdown in the pumped well is as follows:

$$\bar{h}_{wD} = \frac{2[K^0(x) + xS_w K_1(x)]}{p\{pW_D[K_0(x) + xS_w K_1(x)] + xK_1(x)\}}$$

The Laplace transform solution for dimensionless drawdown in an observation well is as follows:

$$\bar{h}_D = \frac{2K^0(r_D x)}{p\{pW_D[K_0(x) + xS_w K_1(x)] + xK_1(x)\}}$$

where:

p = Laplace transform variable

$$x = (p + \bar{q}_D)^{1/2}$$

$$\bar{q}_D = \frac{\gamma^2 m \tanh(m)}{1 + S_f m \tanh(m)}$$

$$m = \frac{(\sigma p)^{1/2}}{\gamma}$$

$$\gamma = \frac{r_w}{b'}\left(\frac{K'}{K}\right)^{1/2}$$

$$\sigma = \frac{S_s'}{S_s}$$

b' = one-half average thickness of slab-shaped blocks [L]

b_s = average thickness of fracture skin [L]

H = aquifer thickness [L]

$$r_D = \frac{r}{r_w}$$

K = hydraulic conductivity of fissure system [L]
K' = hydraulic conductivity of block system [L]
K_s = hydraulic conductivity of fracture skin [L/T]
S_s = specific storage of fissure system [L]
S_s' = specific storage of block system [L]
S_w = wellbore skin [dimensionless]

$$S_f = \frac{K' b_s}{K_s b'} \quad \text{[dimensionless]}$$

$$W_D = \frac{\pi r_c^2}{2\pi r_w^2 S_s H} \quad \text{[dimensionless]}$$

K_0 = modified Bessel function of second kind, zero order
K_1 = modified Bessel function of second kind, first order

Notes:

(1) H = historical data. These water elevations were collected and recorded by others, and were provided to Clear Creek by the Copper Queen Branch. These data are reported exactly as provided, and their accuracies cannot be verified.

MO = water level elevations collected by Hydro Geo Chem and Clear Creek Associates under the Mitigation Order. Some of these water level elevations were calculated using a re-surveyed measuring point elevation.

(2) Assumed measuring point elevation based on elevation provided in earlier gauging data.

Notes:

ADWR = Arizona Department of Water Resources

All results reported in milligrams per liter (mg/L), except pH which is reported in Standard Units

mg/L = milligrams per liter

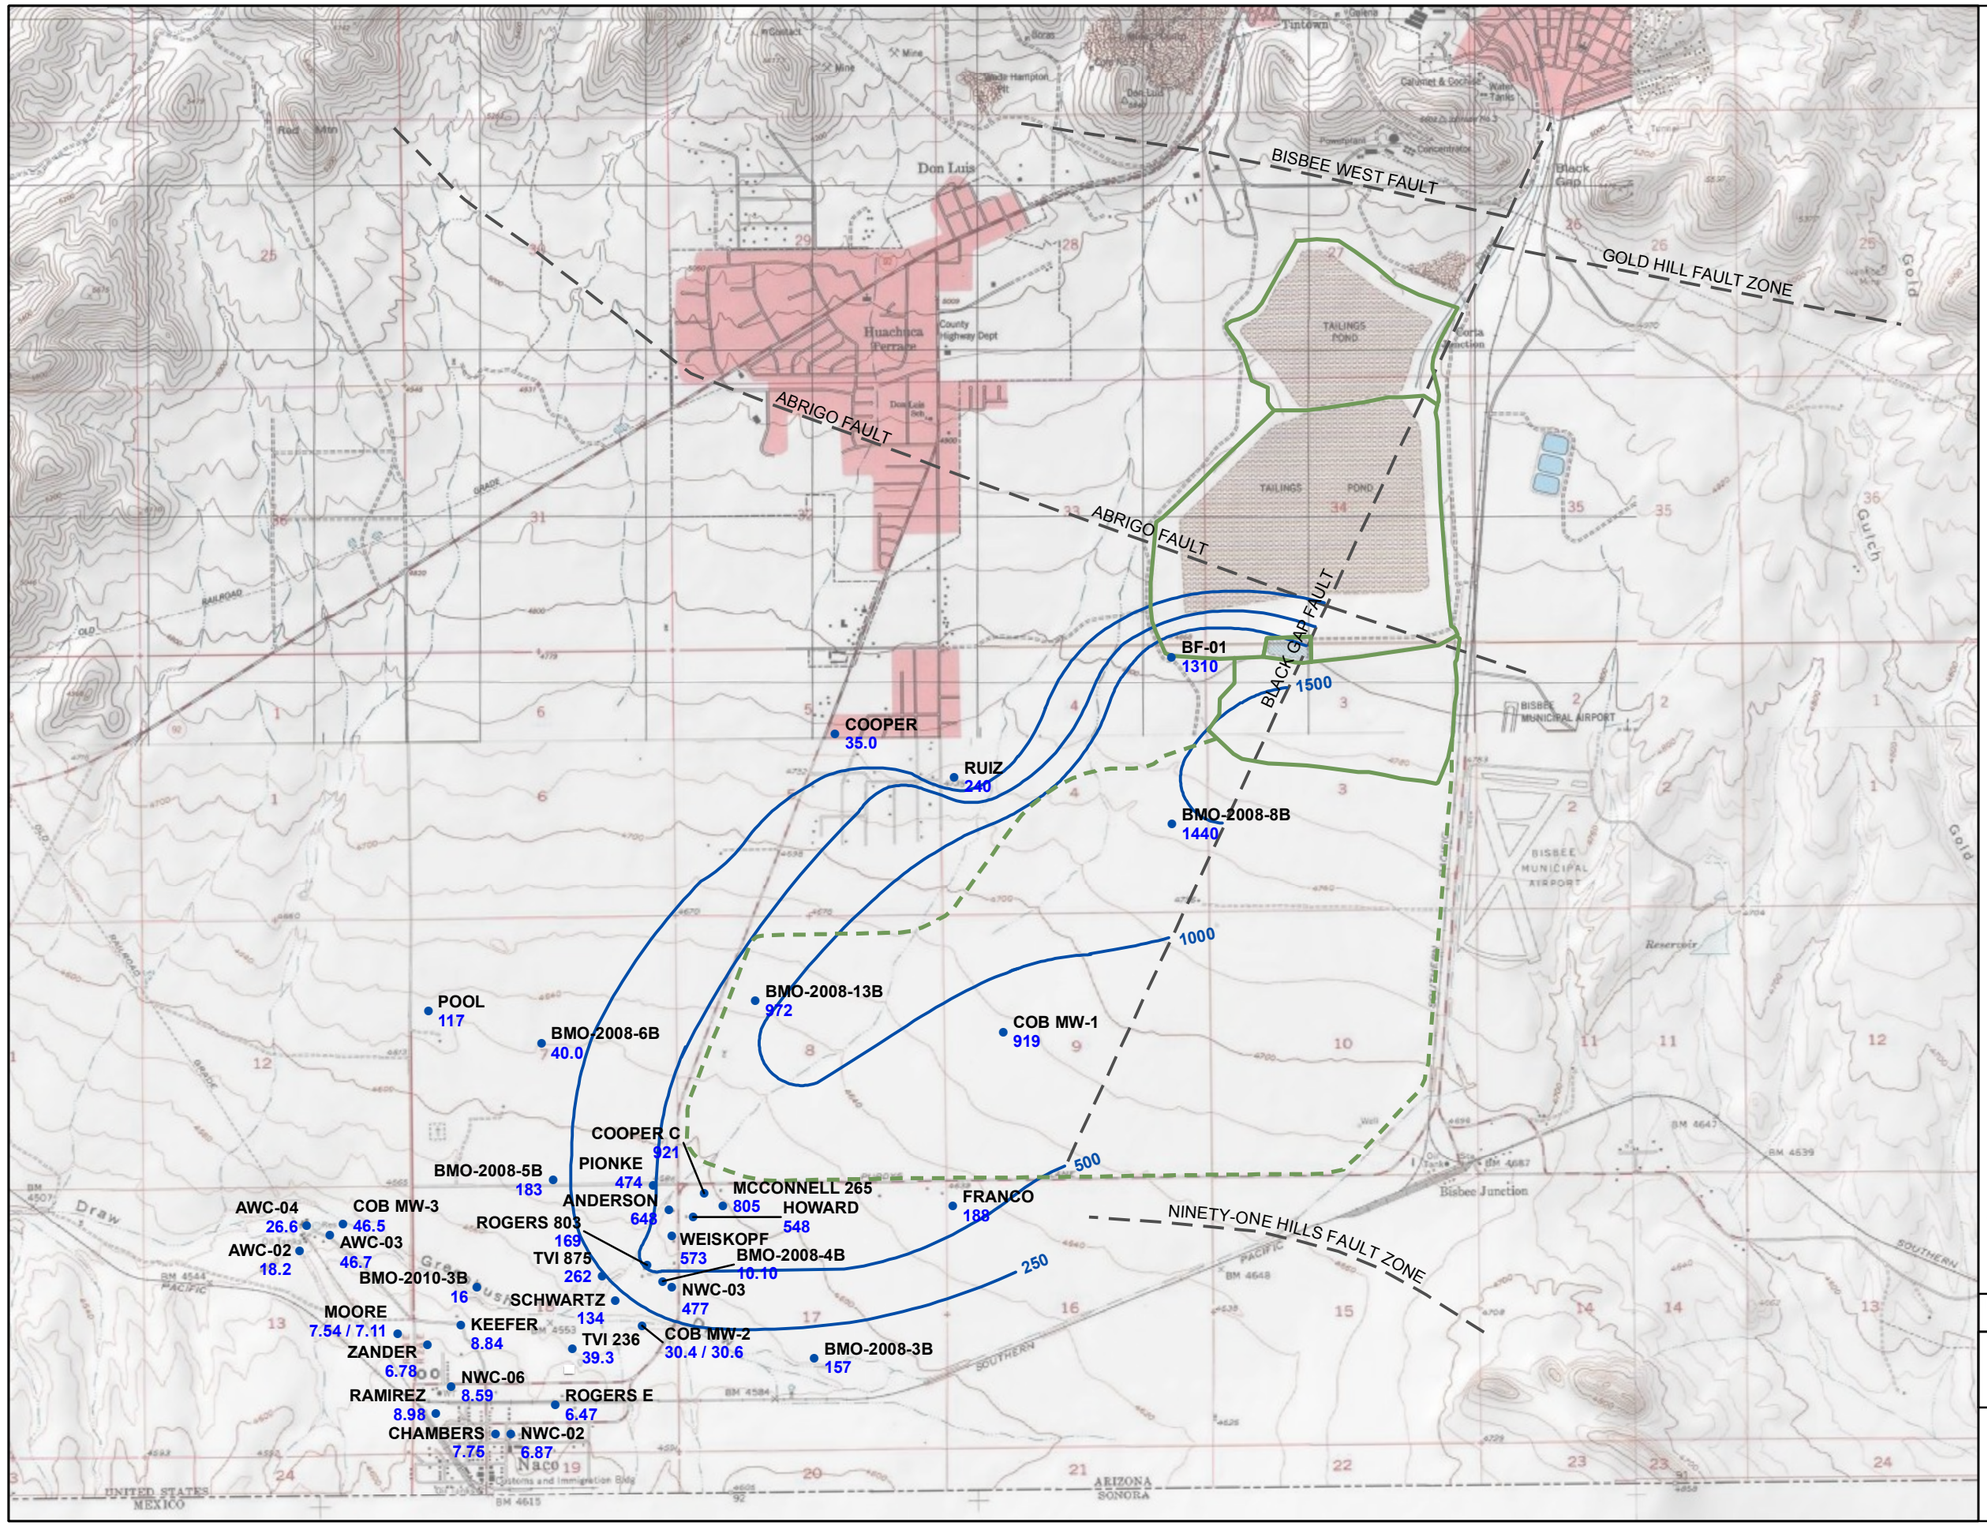
SULFATE CONCENTRATION MAPS FOR HYDROSTRATIGRAPHIC UNITS



Legend

- **POOL** Well ID
- 117 Sulfate Concentration (mg/L)
- Faults (inferred)
- Sulfate Concentration Contour
- CTSA Facility
- Warren Ranch Irrigation Area

Scale (Feet)

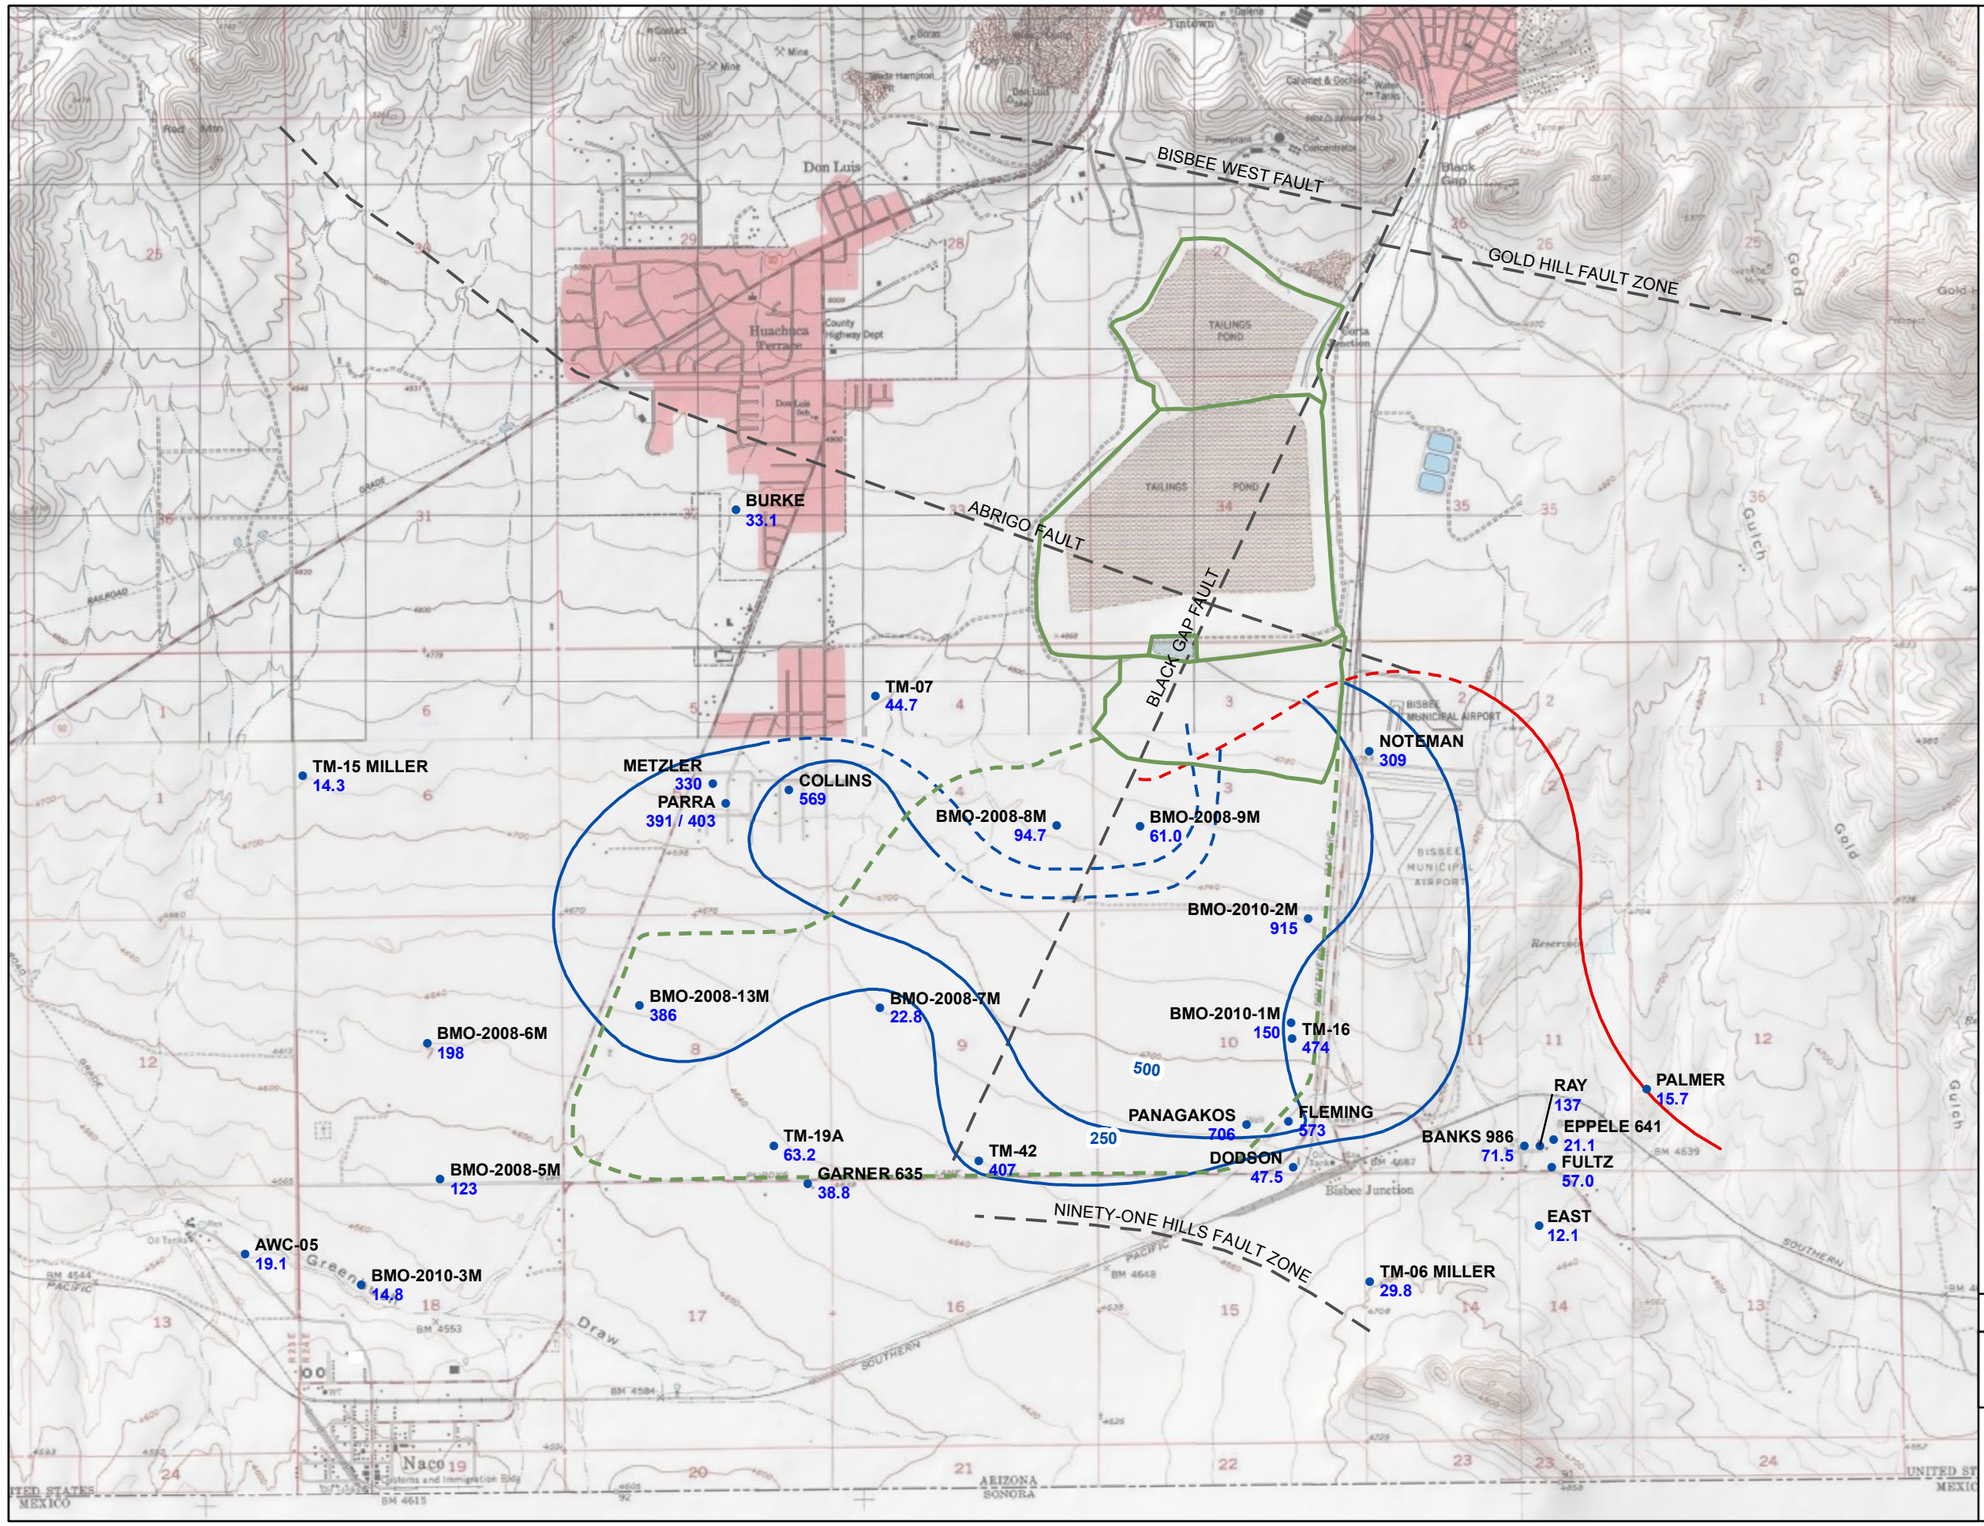
0 3,000 6,000

Notes:
Projection: UTM Zone
12N NAD83

Date	File ID
11/30/10	055038-075

CLEAR CREEK ASSOCIATES

Figure G.3.1
BASIN FILL FORMATION WELLS
SULFATE CONCENTRATIONS
THIRD QUARTER 2010



Legend

- **EAST** Well ID
- 12.1 Sulfate Concentration (mg/L)
- Faults (Inferred)
- Sulfate Concentration Contour
- Northern Edge of Morita Formation
- CTSA Facility
- Warren Ranch Irrigation Area

Undifferentiated Bisbee Group: Cintura, Mural Limestone, and Morita Formations. Dashed where inferred.

Scale (Feet)

0 3,000 6,000

Notes:

Projection: UTM Zone 12N NAD83

Date	File ID
11/30/10	055038-066

Notes:

[1] Well name in parenthesis are those used in SET (1998c)

[2] The pumping rates listed represent maximum pumping rates. Information obtained from ADWR Image Records for wells in the United States. Data for Mexico wells from personal communication with well operators.

[3] from HGC (2008c)

[4] Location, installation year, and pumping rate are approximate

gpm = gallons per minute
ft bgs = feet below ground surface
ft amsl = feet above mean seal level
NA = not applicable
NR = no record
EN = Ejido Naco
UN = Urbano Naco

TABLE H.2
Arizona Water Company Annual Production Totals

Year	Total Production[1] (Mgal)	Average Production Rate (gpm)
1998	359.4302	684
1999	363.9655	692
2000	394.7041	749
2001	370.3547	705
2002	398.1624	758
2003	391.8667	746

NOTES:
[1] From A.A.C. 2007, 2008, 2009, 2010
[2] Individual totals for NWC-02 and NWC-06 not reported.
Mgal = Mega-gallons (10^6 gallons)
gpm = gallons per minute

TABLE H.5: Pumping Information for Naco-Sonora Wells
From HGC (2009c)

City of Naco-Sonora[1]		
Well	**Average Rate (gpm)**	**Notes**
UN-01	0	Abandoned; Pumping rate reported as 127 gpm in 1997[2]
UN-02	412	More than 15 years old
UN-03	143	More than 15 years old; only pumps between April and October. Pumping rate reported as 127 gpm in 1997[2]
UN-04	190	Installed between 1996 and 1998
UN-05	285	installed ~2005; greater than 100m deep and deepest well
Total[3]	**1,030**	
Ejido Naco (El Oasis) Irrigation[4]		
Well	**Average Rate (gpm)**	**Notes**
EN-01	0	Well not in Service
EN-02	873	
EN-03	1587	
EN-05	873	
EN-06	ND	

Notes:

[1] from HGC (2008a) - personnel Communication with Naco-Sonora Public Works operator

[2] from SAIC (1997)

[3] Total disagrees with operator's estimate of a total pumping rate of 635 gpm

[4] from HGC (2008b) -personnel Communication with Ejido Naco representative

gpm = gallons per minute

ND = no data

Re: Bisbee Geophysical Data Reprocessing Report

Introduction: At the request of Jim Norris of Clear Creek Associates, Zonge Engineering has re-processed and run computer models on nine lines of geophysical data acquired in 1988 and 1989 near Bisbee, Arizona. The geophysical data acquired were electrical dipole-dipole resistivity (described below); on some lines, induced polarization data (IP) data were also acquired. The lines consist of three north-south lines and one east-west line acquired by Phelps Dodge Corporation in late 1988 and early 1989, and five east-west lines acquired by Zonge Engineering later in 1989. At the time of these projects, survey results were presented as "pseudo-sections" of resistivity, but computer modeling to produce cross sections through the subsurface was not typically available. This report describes the re-interpretation of the data based on two-dimensional inversion modeling to provide cross sections and depth estimates of subsurface features.

Variations in subsurface moisture content, porosity, permeability, and soil or rock type can all affect resistivity measurements. Dry, tight basement rock is often high resistivity compared to alluvial sediments, for example, and groundwater with high total dissolved solids (TDS) is often lower resistivity than low TDS water. Cultural features (man-made conductive objects such as fences, power lines, pipelines, etc.) can also affect ground resistivity measurements.

The line locations are shown on Figure 1 on a current USGS topographic contour map. Following the discussion of the re-interpreted survey results are appendices containing a description of the survey methodology itself, plan view plots of the data, and cross section plots of the data.

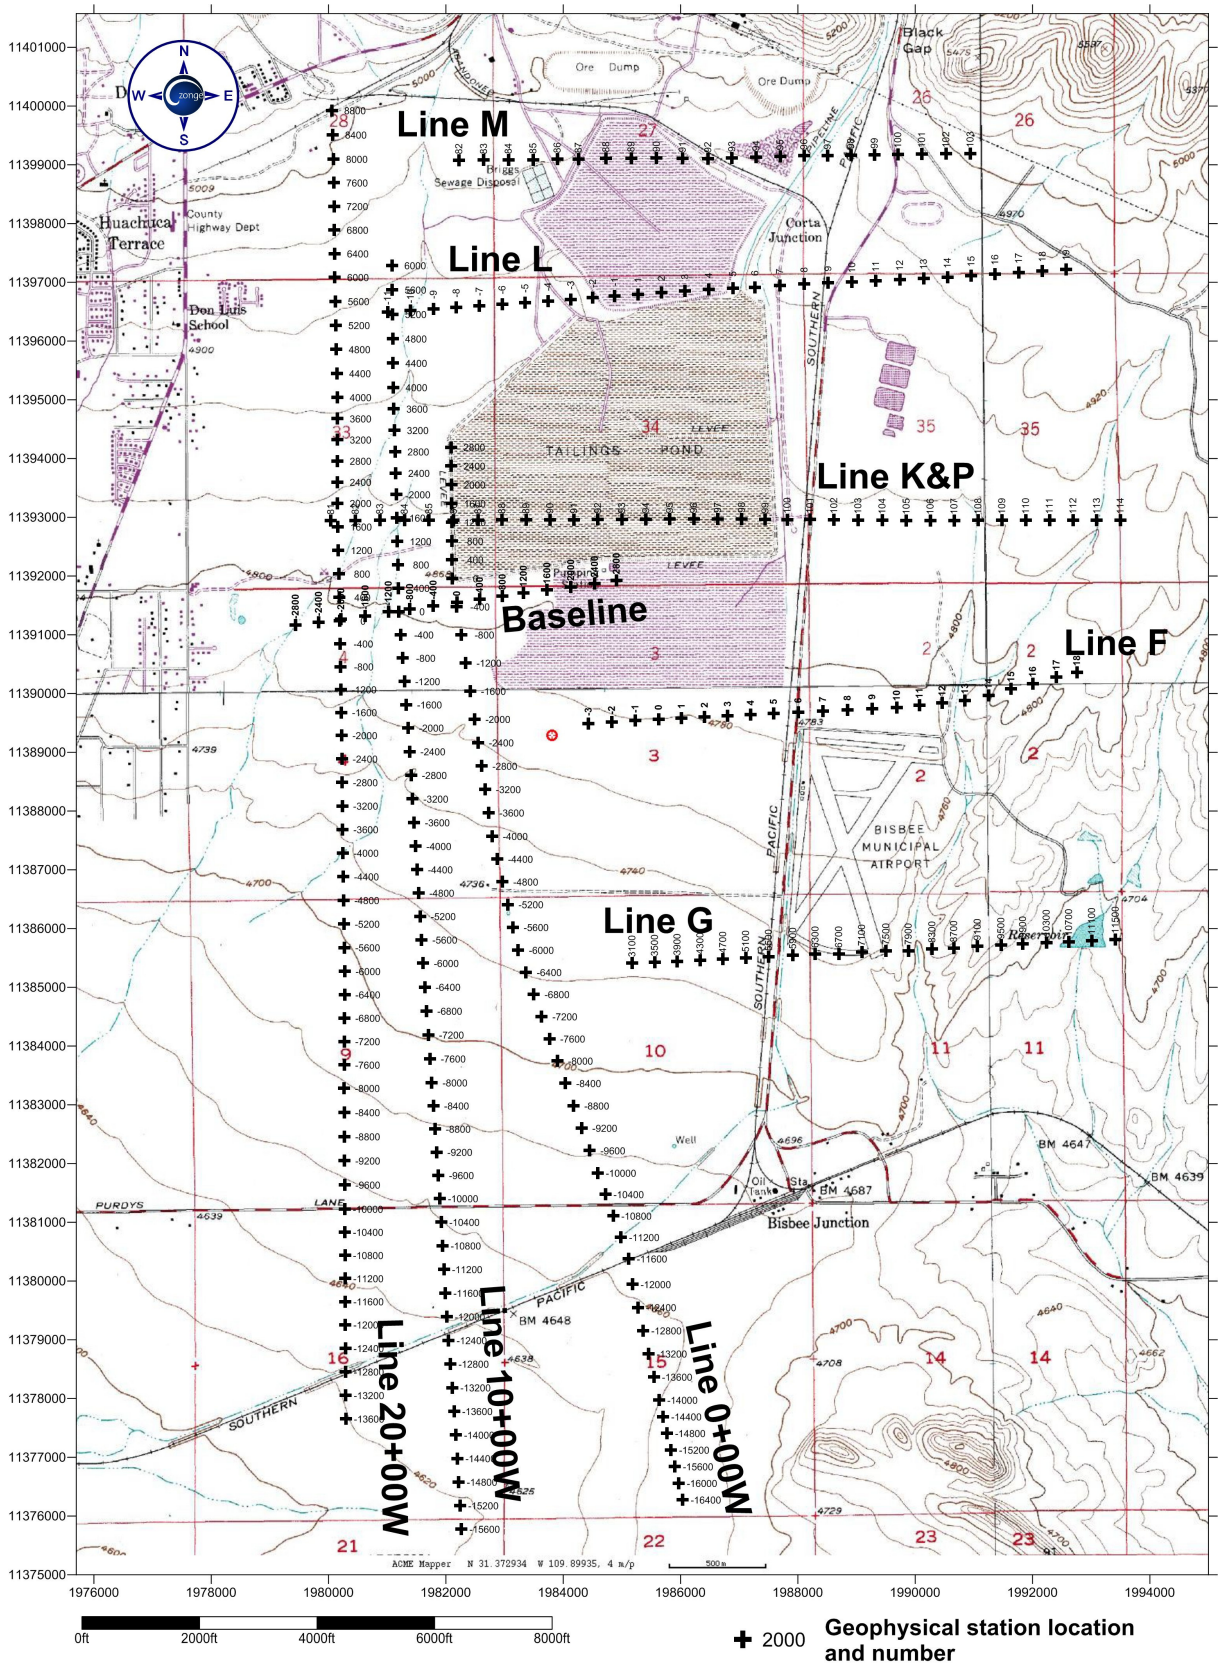

Figure 1- Line and station locations of the 1988-1989 geophysical data.

Re-interpreted Survey Results: Figure 2 below shows the model results as cross sections for each survey line in a "fence-plot" 3D perspective image. In this and other model results, low resistivities are shaded toward orange and red, while high resistivities are shaded toward greens and blues. In general, the model results are realistic. On lines that cross the tailing ponds, for example, the tailings are seen as very low resistivities overlying higher resistivity native material (see Figure 3, for example). The southwestern part of the project area shows low resistivities, increasing in thickness to the south, as would be expected from a thickening zone of saturation within the alluvium and bedrock.

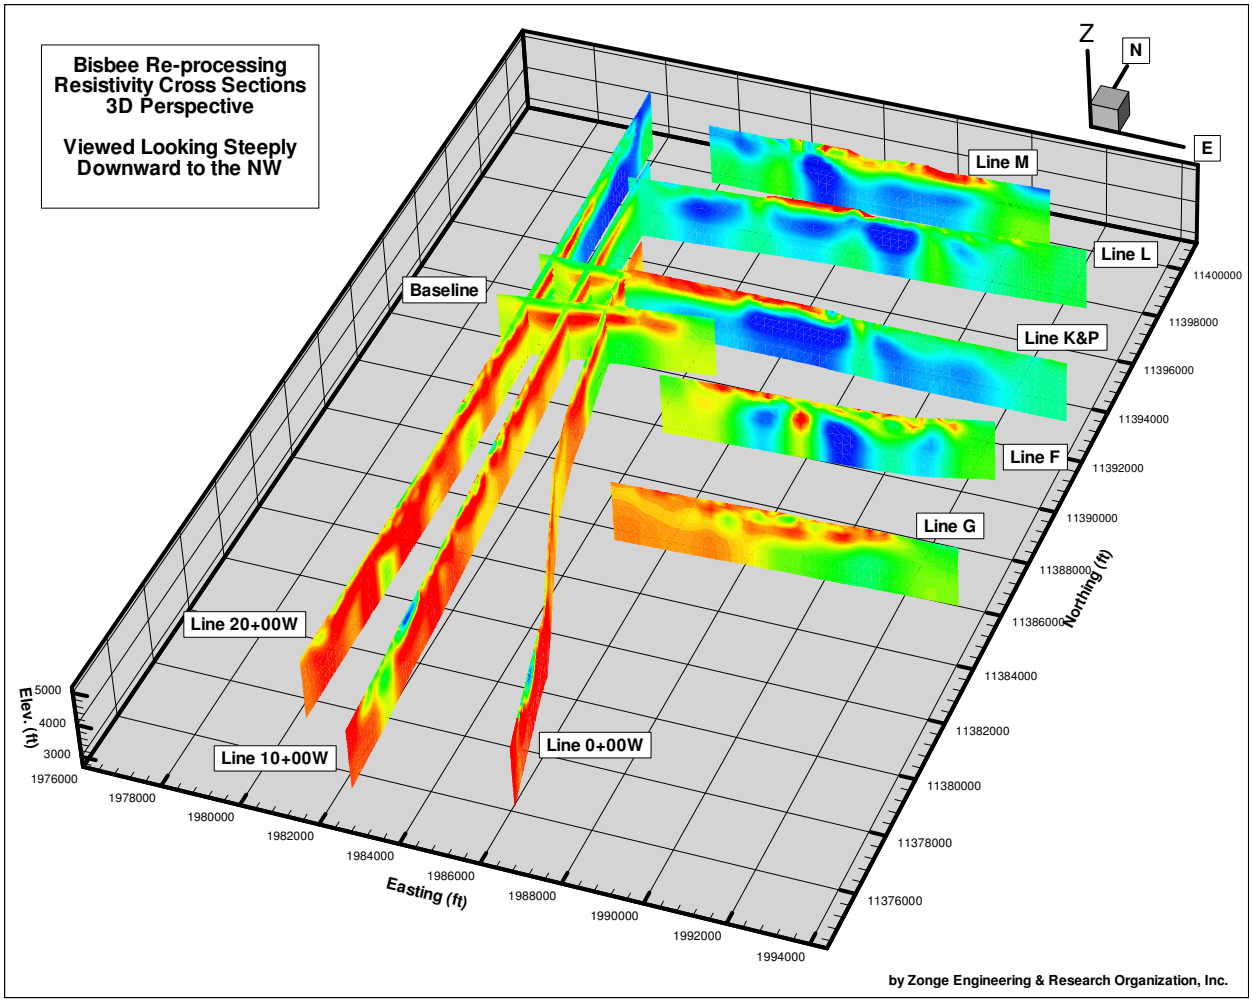

Figure 2- Cross sections of resistivity as a 3D fence plot diagram, showing an increasing thickness of low resistivity material to the south, versus high resistivities in the northern part of the survey area.

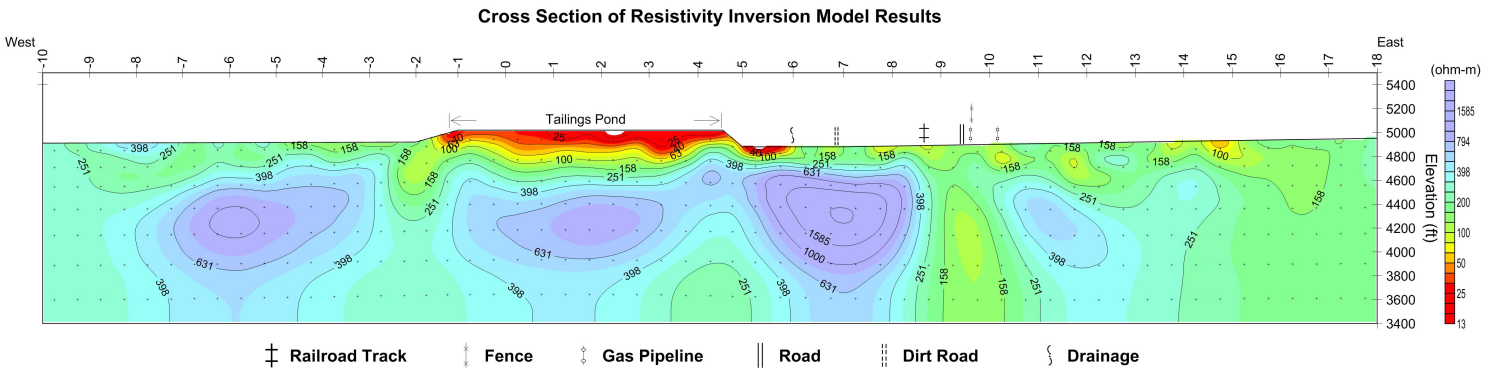

Figure 3- Inversion model results in cross section form for Line L, which crossed the tailings pond. The tailings pond material is evident as very low resistivity (shaded red) compared to the underlying native material.

Several significant features that are evident in the model results are summarized on Figure 4. These features are shown as shaded polygons, labeled Geo-A through Geo-E. Several inferred faults from maps provided by Clear Creek are also shown as heavy black dashed lines.

Geo-A, near the eastern edge of the project area, is interpreted as a fault, oriented approximately north-south. This fault is evident in the deep data on Lines G, F, K&P, L, and M, and is characterized by higher resistivities west of the fault than east; this fault roughly parallels the Glance Fault Zone, which is located approximately two miles further to the east.

The feature labeled Geo-B is also interpreted to be a fault in the deeper data. This fault is seen on Lines G, F, Baseline, K&P, 10+00W, and 20+00W. The fault is characterized by higher resistivities on the northeast. Although Fault Geo-B is in the vicinity of the WNW-ESE trending Abrigo Fault, GeoB appears to be at a different orientation, closer to NW-SE. This orientation is, however, almost parallel to the La Bellota Fault Zone, located approximately four miles to the southeast.

The feature labeled Geo-C consists of anomalously high resistivities in the very shallow data on Lines 0+00W and 10+00W; the model results suggest these high resistivities dip steeply to the south. The close proximity of these high resistivities to outcropping

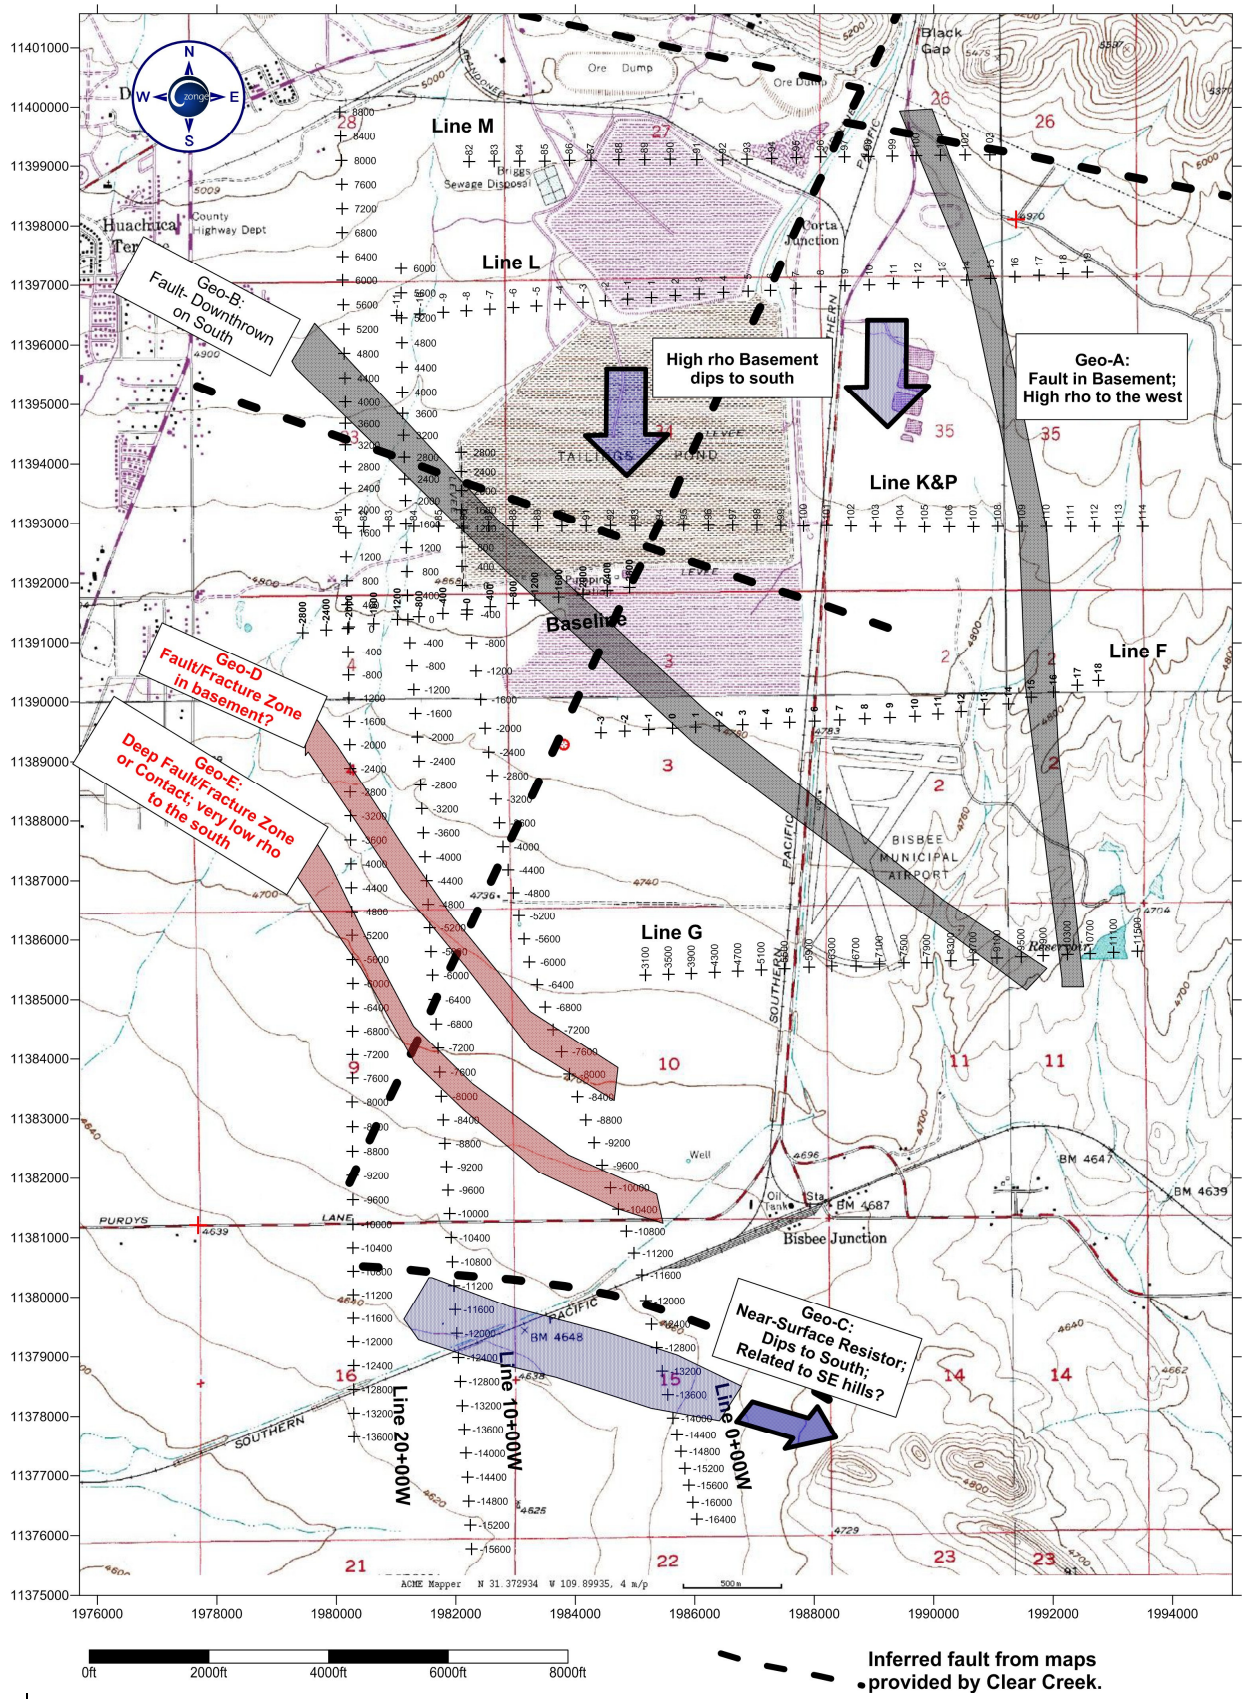

Figure 4- Major interpreted features in the geophysical model results.

limestone hills to the southeast suggests that there is very thin alluvial cover over limestone in this area on Lines 0+00W and 10+00W. It is important to note that this shallow high resistivity feature is not seen on Line 20+00W, which is only about 1000 feet west of Line 10+00W.

Feature Geo-D may be a narrow fault or fracture zone in the basement material, but is a tentative feature; it is low resistivity relative to surrounding stations. It is approximately parallel to feature Geo-B, to the northeast. It is not obvious in the raw data, but is evident in the inversion model results.

Similarly, the feature labeled GEO-E is also tentative, and may represent a deep fault or fracture zone, or a contact in the basement material. Southwest of Geo-E, resistivities are generally very low.

The Black Gap fault, which crosses the project area approximately NE-SW, and should intersect Lines M, L, K&P, 0+00W, 10+00W, and 20+00W is not clearly evident in the resistivity data. A deep fault-like change in resistivity is indeed seen below the tailings pond on Line K&P at approximately station 94, with the downthrown side on the west. However, this location is also very close to the intersection of this line and the inferred location of the NW-SE Abrigo Fault; in addition, a similar feature is not clearly evident on other lines at the inferred location of the Black Gap Fault. The Black Gap Fault may not be evident in the data on some lines due to other complicating factors (such as cultural features near the inferred fault location on Lines M and L). On the north-south lines, the fault may be masked by the very low resistivities southeast of the ponds.

The Abrigo Fault is roughly perpendicular to the Black Gap Fault, and should cross Lines K&P, 0+00W, 10+00W, and 20+00W. Like the Black Gap Fault, the Abrigo is not clearly evident in the resistivity data, although the feature Geo-B is in approximately the right location on several lines, but is oriented roughly N50W, versus the N70W orientation of the inferred Abrigo Fault in this area. Depending on how well-defined the location of the Abrigo Fault is, the feature labeled Geo B may be the Abrigo Fault.

A dominant feature in the data is a layer-like zone of low resistivities, particularly on the north-south lines, that becomes stronger and thicker from north to south. Near the

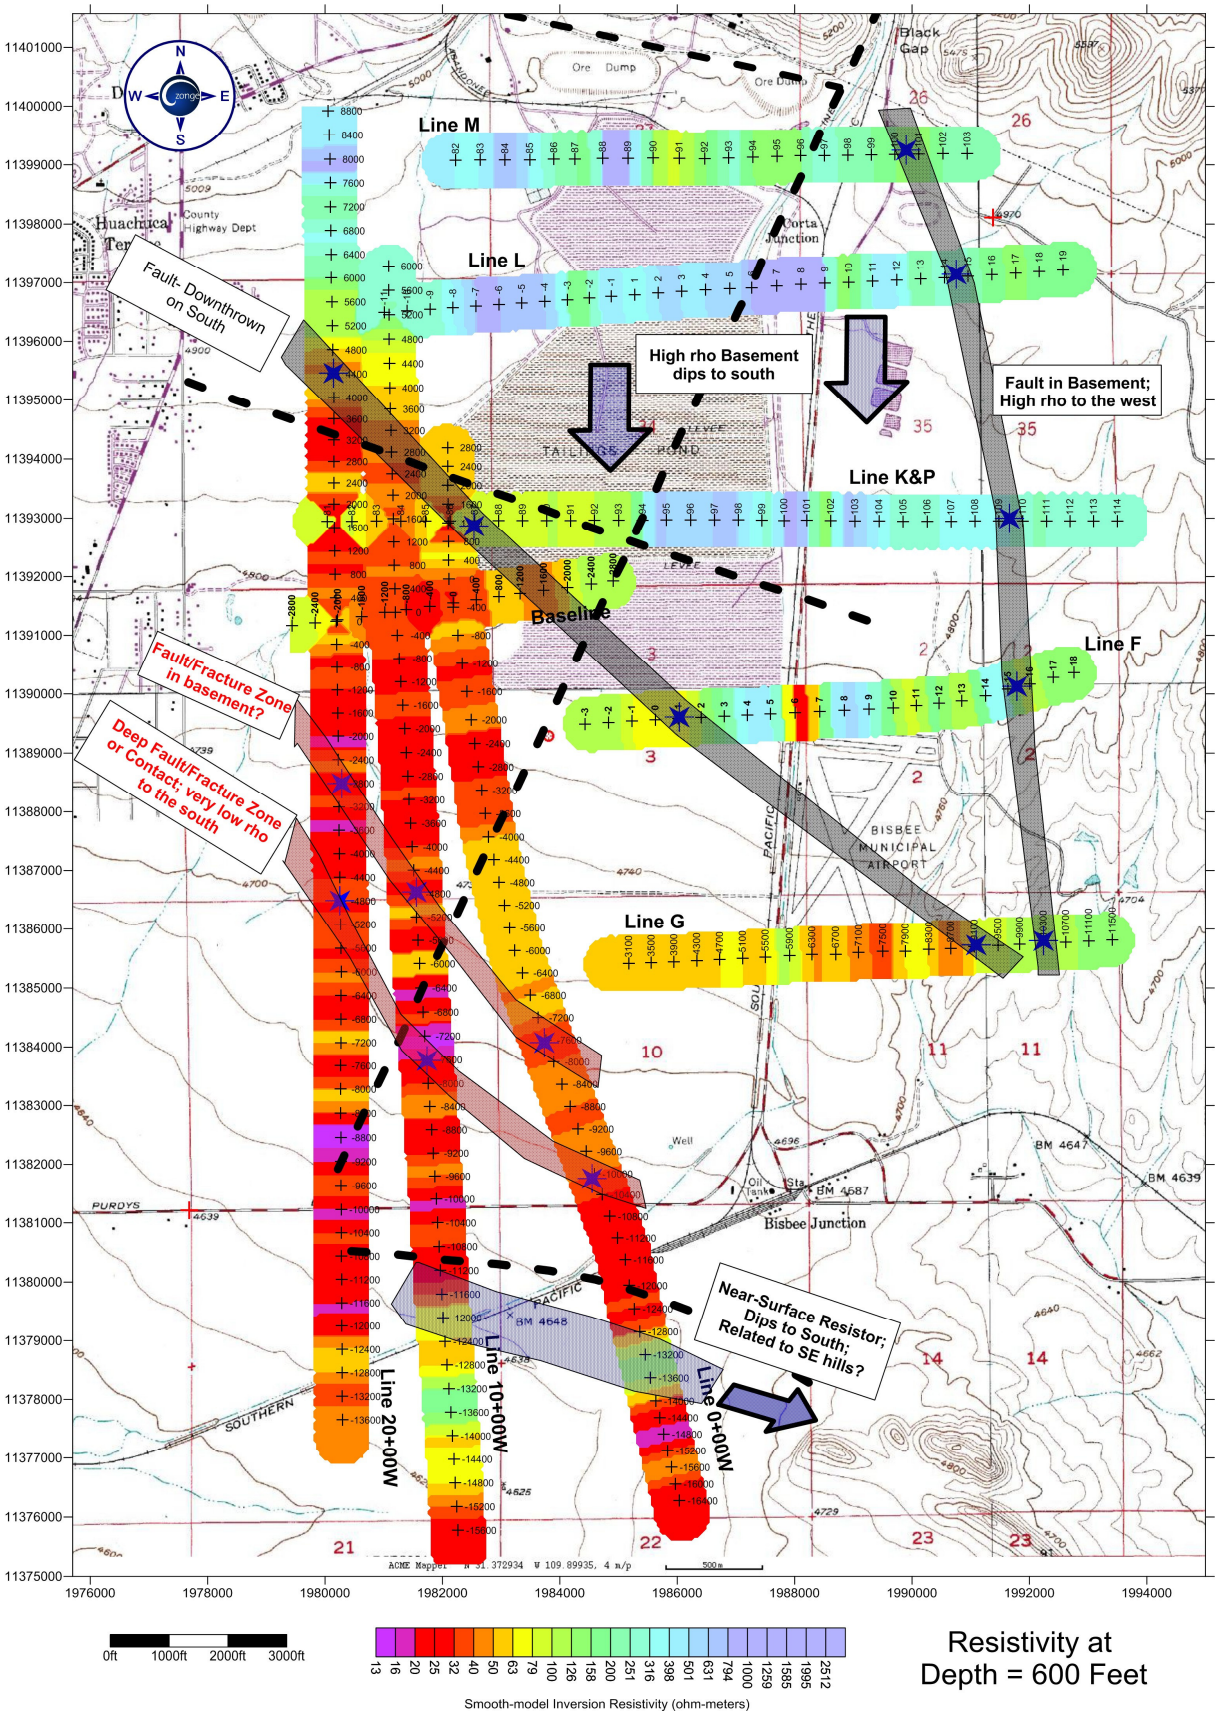

Figure 5- Plan view of resistivities at a depth of 600 feet.

northern end of Lines 10+00W and 20+00W, it is centered at a depth of approximately 500 feet, and gradually thickens and becomes lower resistivity toward the south. It is also evident on the east-west Baseline, where it appears to deepen and strengthen to the west. On Figure 5, this feature is seen as low resistivities (shaded toward orange and red) on Lines 0+00W, 10+00W, and 20+00W south of Geo-B; it is not as strong on Line G (where it is shaded orange) as on the north-south lines, but this appears to be consistent with the nearby central section of Line 0+00W, where resistivities are not quite as low as on the western two lines. These low resistivities are again suggestive of moisture content in the alluvium and bedrock but it is not possible to determine from this data set where the southern boundary of the 250 mg/L impacted solution was in 1989 when the data was acquired.

Lines M, L, and K&P run east-west across the North and South Tailing impoundments. It is notable that while the tailing materials are very low resistivity, as is expected from our previous work on similar sites, probably as a result of mineralization such as pyrite, from moisture, or from both, the materials underneath the tailings have significantly higher resistivity, suggesting that the underlying material is dry or contains low TDS fluids. It is Zonge's understanding that borings drilled through the tailings to the underlying native materials were dry. This is consistent with the resistivity data shown on these lines.

Included as Appendix A is a description of the survey methodology; Appendix B contains cross section plots for each line of data with notes, and Appendix C contains plan view plots of resistivity at depth intervals of 100 feet below the surface from 100 feet to 1000 feet.

Respectfully submitted,

Norman Carlson
Chief Geophysicist

Bisbee Geophysical Data Reprocessing Report

Appendix A

Geophysical Survey Methodology: The geophysical survey conducted in 1988 and 1989 was a resistivity and Induced Polarization (IP) survey acquired in the dipole-dipole configuration. In the dipole-dipole configuration, a controlled electrical signal is transmitted into the ground via a grounded dipole (usually metal stakes in the ground, connected to the transmitter with insulated wire). At varying distances from this dipole, the transmitted signal is received on different grounded dipoles and recorded digitally by the microprocessor controlled receiver electronics.

One electrical property of the ground that can be measured in this manner is called resistivity; a change in ground resistivity (the ability of the ground to conduct electrical current) affects the strength of the received signal. A different electrical property is called chargeability, or induced polarization (IP); a change in IP (the ability of material in the ground to polarize at interfaces) affects the shape or timing of the received waveform.

As noted above, variations in subsurface moisture content, porosity, permeability, and soil or rock type can all affect resistivity measurements. Cultural features (man-made objects such as fences, power lines, pipelines, etc.) can also affect ground resistivity measurements.

Compared to changes in resistivity, there are relatively few subsurface conditions that create an IP response. Metallic mineralization, particularly disseminated sulphides, cause increased IP values. Certain dissolved solids in groundwater have been shown to increase IP response, and in some environments, some types of clay can also increase IP response if the abundance of the clay is within specific ranges (dependent on the type

of clay). Extensive work over landfills has shown increased IP values, but the exact geochemical cause (or causes) of the effects have not been resolved. Like resistivity data, IP data can also be influenced by cultural features.

The resistivity and IP methods are commonly-used exploration tools in the mining, groundwater, and environmental industries. Both methods have been widely available commercially in some form for many decades, and Zonge's experience with both methods extends back to 1972.

Survey Parameters: All nine lines in this data set were acquired using a station (electrode) spacing of 400 feet in order to provide a depth of investigation of at least 800 feet. Data were acquired in the dipole-dipole array from an n-spacing of n=1 to n=6 in 1n increments. Station locations for the 2D inversion modeling were based on hard-copy maps, and station elevations were estimated from USGS topographic maps.

Data Quality: In the absence of raw data and original survey notes, the data quality can only be estimated based on line-to-line consistency and on agreements between the observed data and the calculated results from the computer modeling. On this basis, data quality appears to be fair to good.

Cultural Contamination: Cultural features include man-made conductive objects such as pipelines, power lines, fences, etc. Cultural effects can be noise from active electrical sources such as active power lines and cathodic protection on pipelines, or from passive features which distort the electric fields such as fences or pipelines. This project area had fences intersecting most lines, as well as pipelines and railroad tracks that crossed some lines. Cultural features are shown on the line cross sections, and their interpreted effects are discussed below.

Smooth-Model Inversion: Since the dipole-dipole array is not a vertical sounding method, a buried responder or change in resistivity can affect measurements that are not directly over the responder, making the interpretation of location, size, and depth very difficult. Briefly, smooth-model inversion mathematically "back-calculates" (or "inverts") from the measured data to determine a likely location, size and depth of the source or sources of resistivity and IP changes. The results of the smooth-model

inversion are intentionally gradational, rather than showing abrupt, “blocky” changes in the subsurface.

The inversion results should not be considered a unique solution, and some ambiguity remains in any mathematical representation of the data. The likelihood that the interpretation is correct increases with corroborating information, of course. The smooth-model inversion program is called “TS2DIP”, written by Scott MacInnes of Zonge Engineering & Research Organization, Inc., and discussed in more detail in his paper “Two-dimensional Inversion of Resistivity and IP Data with Topography”, presented in the Geophysics Session, Northwest Mining Association Convention, December, 1996.

Bisbee Geophysical Data Reprocessing Report

Appendix B

Cross Section Data Plots and Notes: The survey results are presented in the attached figures as cross sections along each line of resistivity data. Station numbers are along the top of each cross section, and elevations (msl) in feet are shown down the side of the cross section. Resistivity data are in ohm-meters, with warm colors (orange, red) indicating low resistivity, and cool colors (green, blue) indicating high resistivity. The resistivity data are contoured logarithmically. The top plot in each image is the cross section of the final inversion model results. The bottom plot in the image is the raw data (labeled "observed apparent resistivity"), and the middle plot is the calculated response of the model. When the agreement between the raw and calculated results (bottom and middle plots) is good, this suggests realistic, valid measurements. When the agreement is not good, meaning the computer model is not able to replicate the field data, it suggests possible problems such as very noisy data, strong 3D (off-line) effects, cultural effects, equipment or operational problems of some kind. Interpretation of the data is based on the modeled cross sections of resistivity including the observed (raw) data, model results, and location of known cultural features. Following is a line-by-line chart of interpretation notes for the resistivity data for each line.

Line M	Good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate tailings ponds along this line, as well as an area simply called “ponds”. The upper 200 feet from station 87 to 99 is low resistivity, probably from tailings, the “ponds”, and culture (pipeline, powerline, and railroad tracks from station 96 to 98). Below the tailings, resistivities are very high; possible break in these deep high resistivities at station 91. Data acquired by Zonge Engineering.
Line L	Very good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate a tailings pond from station -1 to 4.5, and pipelines, powerlines, fences, and railroad tracks from station 8.5 to 10.5. Upper 150-200 feet of the tailings pond is very low resistivity, as expected from tailings. Below the tailings, resistivities are very high, but decrease east of station 14. A possible break in the deep high resistivities at station 9.5 is probably the result of a pipeline, fence, and road in that vicinity. Possible breaks in the deep high resistivities at stations -2 and 4.5 may be due to artificial edge effects from the very low resistivity tailings. Data acquired by Zonge Engineering.

Line K&P	Very good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate a tailings pond from station 86 to 99, and pipelines, powerlines, fences, and railroad tracks from station 99.5 to 101, with fences also seen near station 103 and 105. Upper 150-200 feet of the tailings pond is very low resistivity, as expected from tailings. Below the tailings, very high resistivities are seen from station 94 to 100; a possible break in these high resistivities at station 101 is probably the result of cultural features from station 100 to 101. A fault may be indicated below the tailings pond at station 94; east of this location, resistivities are very high, but west of the location, resistivities are only moderately high. A moderately low resistivity finger extending downward to the west from the approximately station 86 could be fluids, a cultural effect from an un-noted source, or an unusual artificial edge effect from the edge of the tailing pond. It is, however consistent with data in that vicinity on the north-south lines. Data acquired by Zonge Engineering.
Baseline	Very good agreement between raw data and model results, suggesting realistic data. There are no culture notes on the hard-copy pseudosection for this line. The shallowest data on this line suggests that this line was not on tailings material at the time of acquisition; the upper 100-200 feet are moderately high resistivity. The low resistivity zone that appears to dip and thicken to the west on this line is consistent with the low resistivity zone that dominates the north-south lines. These low resistivities on this line probably continue to extend to the west, but the modeling artificially closes it off due to a lack of data. Data acquired by Phelps Dodge Corp.

Line F	Very good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate no tailings pond crossings on this line, but a pipeline, powerline, fence, railroad track and road near station 6; this is likely the source of the "bulls-eye" low resistivity anomaly at that location. Surface resistivities are very irregular along this line; at depth, high resistivities extend from about station 2 to station 15. Data acquired by Zonge Engineering.
Line G	Very good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate no tailings pond crossings on this line, but numerous cultural features intersected at different locations on this line. No strong cultural effects are interpreted on this line, however. Like Line F to the north, surface resistivities are very irregular along this line, although not as low in resistivity as on Line F. Moderately high resistivities are seen at depth on the eastern end of the line only; no high resistivity material is evident at all. Similarly, no very low resistivity material is seen that is similar to either the very low tailings pond values or the southern ends of the north-south lines. Data acquired by Zonge Engineering.

Line 0+00W	Good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate no tailings pond crossings on this line, but a powerline and several fences were crossed. Railroad tracks, and a pipeline may have also been crossed near station -11800, based on maps of the area. No strong cultural effects are interpreted on this line. Surface resistivities are irregular along this line; north of station -3600, resistivities are moderately high. South of station -3600, surface resistivities are moderately low to low, although stations -12800 to -15200 are high resistivity. No significant cultural features are seen in this area that might be causing these unusually high values. These high values are very similar to data on the adjacent Line 10+00W, at stations -11200 to -14400. A low resistivity layer is seen centered at a depth of approximately 400 feet from station -3600 to the north end of the line. Moderately low and low resistivities dominate the line from station -3600 to the south end of the line. Moderately low resistivities in the center of the line (approximately station -6000) are consistent with the moderate values on the west end of Line G. Very low resistivities on the southern third of the line are consistent with data on the southern parts of Lines 10+00W and 20+00W. Data acquired by Phelps Dodge Corp.
Line 10+00W	Very good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate no tailings pond crossings on this line, but several cultural features, including railroad tracks near station -12400. No strong cultural effects are interpreted on this line. North of station -2800, surface resistivities are moderately high. South of station -2800, surface resistivities are irregular. Unusual surface high resistivities are seen from station -11200 to -14400;

Line 10+00W (cont'd.)	this feature is similar to high resistivities on Line 0+00W, as noted above. A low resistivity layer, centered approximately 400 feet deep is seen extending from about station 3200 on the north to station -12800 where it is truncated by the high resistivities in that area. This low resistivity layer thickens to the south, but becomes somewhat irregular in shape south of approximately station -4400. This line is very similar in appearance to Line 20+00W, located approximately 1000 feet to the west. Data acquired by Phelps Dodge Corp.

Line 20+00W	Very good agreement between raw data and model results, suggesting realistic data. Culture notes on the hard-copy pseudosections indicate no tailings pond crossings on this line, but several cultural features, including railroad tracks near station -12800. No strong cultural effects are interpreted on this line, although fences and a road may be contributing to low resistivities beneath stations -10000 to -10400. . North of station -2000, surface resistivities are moderately high. South of station -2000, surface resistivities are irregular. No unusual surface high resistivities are seen on this line that are similar to those seen on Line 10+00W from station -11200 to -14400, discussed above. A low resistivity layer, centered approximately 400 feet deep is seen extending from about station 4400 on the north to the south end of the line at station -13200. This low resistivity layer thickens to the south, but becomes somewhat irregular in shape south of approximately station -6000. This line is very similar in appearance to Line 10+00W, located approximately 1000 feet to the east.

Bisbee Geophysical Data Reprocessing Report

Appendix C

Plan View Data Plots: The survey results are presented in the attached figures as plan views of resistivity at constant depths below the ground surface. Resistivity data are in ohm-meters, and are shaded identically to the cross sections in Appendix B, with warm colors (orange, red) indicating low resistivity, and cool colors (green, blue) indicating high resistivity. Black contours have been removed for clarity. Due to the large line spacing, particularly between the east-west lines, the data have not been interpolated between lines.

APPENDIX J

GEOLOGIC LOGS FOR MONITORING WELLS INSTALLED IN 2008 AND 2010

HYDRO GEO CHEM, INC.

Geologic Boring Log

		Boring No.:	**BMO-2008-1G**
Project Name:	**Bisbee Mitigation Order**		Project No.: 872000
Drilling Company:	WDC Exploration and Wells, Inc.	Driller:	Billy Berg
Site Plan at Boring Location:		ADWR Registration No.:	**55-909474**
		Drilling Equipment:	GEFCO-Speedstar 50K
		Drilling Method:	Stratex; tricone
		Bit Type/Size:	12"; 8.5"
		Total Borehole Depth:	320 ft bls
		Casing Depth:	310 ft bls
		Screened Interval:	180-300 ft bls
		Screen slot size:	0.125", vertical slots
		Filter pack type:	#8 Tacna gravel
		Top of Casing Elevation:	4805.10
		Land surface Elevation:	4804.60 (pad)
		Date/Time Started:	7/29/08 10:08
		Date/Time Completed:	7/31/08 12:59
Township, Range, Section: T 24 S, R 24 E Sec. 2 CAA		Logged by:	K. Wilson
UTM: 3471723.644 N, 606467.681 E, NAD 83		Checked by:	R. Zimmerman

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
10	Basin Fill	15	55	30	SC	2.5YR 5/4	S	Reddish brown clayey sand with gravel, well cemented with caliche. Gravel fraction includes clasts of gray phyllite, quartz, brown fine-grained sandstone, gray limestone, silicified limestone, and caliche chunks; most clasts angular to subangular. Sand-sized particles include caliche chips, angular to subrounded quartz, and lithic grains.
20		30	40	30	SC	2.5YR 6/3	S	Light reddish brown clayey sand with gravel, well-cemented with caliche. Gravel clasts include phyllite, quartz, brown sandstone, green quartzite and siltstone, and gray limestone; clasts are mostly angular to subangular. Gravel-sized caliche chunks are also present in the sample. Sand is fine to coarse-grained. Clay occurs as balls and as a component of the caliche cement.
30		60	25	15	GM	2.5YR 6/2 - 2.5YR 7/2	S	Pale red silty gravel with sand. Gravel clasts and sand-sized lithic grains are primarily brown, gray, white, and green fine-grained quartz sandstones, with lesser amounts of phyllite, quartz, and limestone. Caliche cement.
40		65	30	5	GP	2.5YR 5/3	M	Reddish brown gravel with sand. Silty sandstone fragments and caliche chips. Material appears to be caliche-cemented sandstone rubble.
50	Morita Formation				bedrock	2.5YR 4/6	S	Red calcareous mudstone. Rock is composed of lithified mixture of clay, silt, and small amounts of fine-grained sand. Top of bedrock; Morita Formation.
60						10R 6/1-6/2	S	Reddish gray to pale red calcareous clayey siltstone. Few small (< 1 mm) white bleached spots; fissile, moderately laminated; Morita Formation. Note: Water level rose to 61 ft bls 24 hours, after intercepting first formation water (other than dampness) during drilling at 210 ft bls.
70						10R 5/3	N	Weak red sandy siltstone with few pebbly layers. Pebbles are primarily phyllite derived from the Pinal Schist. Lower portion of the Morita Formation. Damp.
80						2.5YR 5/3	N	Reddish brown sandy to pebbly siltstone. Siltstone contains pebbles derived mostly from the Pinal Schist. Morita Formation. Dry.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-1G**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
90	Morita Formation					10R 5/3	W	Weak red sandy siltstone. Sand in the siltstone is fine-grained. Few tiny (<0.5 mm) cream-colored bleached spots; slightly calcareous. Morita Formation. Dry.
100						2.5YR 5/6	N	Red clayey siltstone with few coarse sand-sized to fine gravel-sized pebbles of phyllite. Material is very broken. Morita Formation. Wet.
110						2.5YR 5/4 to 4/4	N	Reddish brown clayey siltstone, locally bleached along fractures. Material is highly fractured and powdery. Morita Formation. Damp.
120						2.5YR 5/4	W	Reddish brown fine sandy siltstone. Few very fine opaque grains that appear to be specularite. Locally bleached along fractures; few small (< 1 mm) reduction (bleached) spots along bedding laminae. Morita Formation. Slightly damp.
130						2.5YR 5/6 to 4/4	W	Red to reddish brown fine sandy siltstone with localized bleaching along fractures; < 1 % disseminated fine-grained gray opaques. Morita Formation. Damp.
140						5YR 5/3	W-N	Reddish brown fine sandy siltstone. Uniform color and texture. Slight HCL reactivity is observed only in a portion of the fines. Hue is more yellowish than previous intervals. Morita Formation. Damp.
150						5YR 5/3	N	Reddish brown sandy siltstone with scattered reddish gray phyllite and few quartzite pebbles and coarse sand-sized lithic grains. Morita Formation. Damp.
160						2.5YR 5/4	N	Reddish brown sandy and pebbly siltstone with few light colored reduction spots. Pebbles are phyllite and quartz derived from the Pinal Schist. Hue less yellow than above. Sample is approximately 90% siltstone and 10% gravel clasts; transitional contact zone between the Morita Formation and the underlying Glance Conglomerate. Wet.
170	Glance Conglomerate					2.5YR 5/4	N	Reddish brown conglomerate. Pinal Schist clasts (phyllite and metamorphic quartz) in sandy siltstone matrix. Glance Conglomerate. Damp.
180						2.5YR 5/4	N	Reddish brown conglomeratic sandy siltstone. Material is about 65% sandy siltstone and 35% phyllite pebbles derived from the Pinal Schist. Glance Conglomerate. Damp.
190						2.5YR 5/4	N	Reddish brown fine sandy clayey siltstone. < 1 % fine gray metallic opaques (probably specularite); few small cream-colored reduction spots. Approximately 5% of the sample is small pebble to sand-sized phyllite and quartz clasts. Sample sticky and clayey. Damp.
200						2.5YR 5/4	M	Reddish brown silty sandstone. Sandstone is composed of poorly sorted quartz grains with approximately 1% gray opaques. Sandstone bed in the Glance Conglomerate. Damp.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-1G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
210	Glance Conglomerate					2.5YR 5/4	N	Reddish brown conglomerate. 50% phyllite and quartz clasts in silty sandstone matrix. Several clay balls. Glance Conglomerate. First water; formation is producing a small amount of water.
220						2.5YR 5/4	N	Reddish brown fine sandy siltstone. Trace amount of coarse sand-sized lithic grains of phyllite and quartz. Few clay balls. Sandy siltstone bed in the Glance Conglomerate.
230						2.5YR 5/3	N	Reddish brown silty fine-grained sandstone. < 1 % black opaques, including magnetite, and possibly some fine-grained specularite. Silty sandstone bed in the Glance Conglomerate. Changed drilling method from Stratex system to reverse circulation with a 10.5" tricone bit at 230 ft bls.
240						2.5YR 5/3	N	Reddish brown conglomerate. Pinal Schist gravel clasts (phyllite and milky quartz) in a silty, well indurated matrix. Tricone bit grinds sample to a greater degree than the Stratex. Glance Conglomerate.
250						2.5YR 4/3	N	Reddish brown siltstone. Uniform texture and color other than few scattered small cream-colored reduction spots. Siltstone bed in the Glance Conglomerate.
260						2.5YR 5/3	N	Reddish brown arkosic silty fine-grained sandstone. Sand grains are poorly sorted, mostly quartz with some fine lithic grains, and about 1% black and gray opaques, including magnetite and specularite. Silty sandstone bed in the Glance Conglomerate.
270						2.5YR 5/3 to 5/2	N	Reddish brown conglomerate. Reddish gray phyllite and white quartz clasts derived from the Pinal Schist in a reddish brown silty sandstone indurated matrix. Glance Conglomerate.
280						2.5YR 5/3	N	Reddish brown pebbly silty sandstone. Sandstone contains approximately 10% phyllite and metamorphic quartz pebbles derived from the Pinal Schist. Glance Conglomerate.
290						2.5YR 5/3	N	Reddish brown conglomerate. Phyllite and metamorphic quartz clasts derived from the Pinal Schist in an indurated silty sandstone matrix. Glance Conglomerate.
300						2.5YR 5/3	N	Reddish brown conglomerate. Reddish gray Pinal Schist clasts in reddish brown, indurated sandy siltstone matrix. Glance Conglomerate.
310						2.5YR 5/3	N	Reddish brown conglomerate. Reddish gray Pinal Schist clasts in reddish brown, indurated sandy siltstone matrix. Glance Conglomerate.
320						2.5YR 4/2 to 4/3	W	Weak red to reddish brown silty fine-grained sandstone. Few fine gravel to sand-sized Pinal Schist (phyllite and metamorphic quartz) clasts. Glance Conglomerate. T.D. = 320 ft bls at 12:59 on 7/31/2008

UTM: 3467919.582 N, 602012.923 E, NAD 83		Checked by:	K. Wilson and R. Zimmerman

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
0	Basin Fill			100	ML	2.5YR 5/6	N	Red silt. Powdery, loose, dry, no reaction to HCl.
10				100	ML	2.5YR 5/4	M	Reddish brown silt. Powdery, flour-like texture, dry; moderate reaction to HCl. Few caliche chips and chunks.
20		5	5	90	ML	2.5YR 5/4	S	Reddish brown silt. Small amount of gravel and sand. Gravel clasts are up to 1/2" diameter, subangular to rounded, composed of crystalline limestone, fine-grained sandstone, and phyllite and metamorphic quartz derived from the Pinal Schist. Few chunks of caliche. Sand is coarse through very fine-grained. Silt is dry, loose, powdery; very strong reaction to HCl.
30		tr	tr	100	ML	2.5YR 5/4	S	Reddish brown silt. Soft, powdery, flour-like texture, dry, strong reaction to HCl. Some clayey caliche chips. Few fine gravel to coarse sand-sized phyllite clasts with caliche surface coatings.
40		20	55	25	SM	5YR 6/3	S	Light reddish brown silty sand with gravel. Gravel clasts are up to 1" in diameter, angular to rounded, composed primarily of limestone, with few carbonate cemented fine-grained sandstones, phyllite and quartz derived from the Pinal Schist, quartzite, and rare feldspar porphyry. Sand fraction is coarse through very fine-grained, but primarily fine-grained, and composed of quartz, lithic grains, and a small amount of magnetite. Few caliche chunks. Loose dry mix; strong reaction to HCl.
50		25	60	15	SM	5 YR 6/3	S	Reddish brown silty sand with gravel. As above, with decreased fines. Gravel composition is as above with trace volcanic clasts in addition. Little caliche.
60		35	50	15	SM	5 YR 7/3	S	Pink silty sand with gravel. Gravel clasts are up to 1" in diameter, subangular to rounded, composed of primarily dark through light gray crystalline limestone, reddish brown very fine-grained sandstone, and arkosic silty sandstone, with few Pinal Schist, and trace fine volcanic porphyry and tuff clasts. Sand fraction is coarse through very fine-grained, moderately well-graded through to silt. Loose, dry, very strong reaction to HCl.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-3B**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
70	Basin Fill		40	60	ML	2.5YR 6/3	S	Light reddish brown sandy silt. Sand fraction is fine to very fine-grained; loose, powdery mix, dry, very strong reaction to HCl.
80		30	50	20	SM	2.5YR 5/3	S	Light reddish brown silty sand with gravel. Gravel clasts are up to 1/2" in diameter, angular to rounded, composed primarily of limestones, quartzite, brick red very fine-grained sandstone, phyllite, white tuff, and trace feldspar porphyry. Few calcareous clay coatings on clasts. Sand fraction is coarse through very fine-grained but primarily fine-grained. Loose, dry, strong reaction to HCl.
90		30	50	20	SM	2.5YR 5/3	S	Reddish brown silty sand with gravel. As above, but gravel fraction has lesser amount of limestone compared to previous intervals, and has abundant phyllite and quartz derived from the Pinal Schist, arkosic sandstone, siltstone, and trace feldspar porphyry. Some calcareous clay coatings on clasts. Sand fraction as above.
100		30	50	20	SM	2.5YR 5/3	S	Reddish brown silty sand with gravel. As above; gravel is comprised of abundant reddish brown sandstone, siltstone, phyllite, and quartz with lesser limestone and trace amounts of feldspar porphyry and white tuff. Few calcareous coatings on weathered surfaces.
110		25	50	25	SM	2.5YR 5/3	S	Reddish brown silty sand with gravel. As above.
120			60	40	SM	2.5YR 6/3	S	Light reddish brown silty sand. Sand fraction is fine to very fine-grained, powdery, loose, dry; composed of quartz and lithic grains and approximately 1% magnetite. Very strong reaction to HCl.
130		20	70	10	SW-SM	7.5YR 7/2	S	Pinkish gray sand with silt and gravel. Gravel clasts are up to 1" in diameter; subangular to well-rounded, composed of dark through very light gray limestone, reddish brown silty sandstone, fine-grained quartz sandstone, phyllite, and trace amounts of fine-grained volcanics and feldspar porphyry. Loose, dry, strong reaction to HCl.
140		80	10	10	GW-GM	7.5YR 7/3	S	Pink gravel with silt. Gravel clasts are up to 1" diameter; subangular to well-rounded, primarily gray to white and pinkish limestone, with some fine-grained sandstone, siltstone, quartzite, phyllite, and white tuff. Few calcite coatings on pebbles. Loose, dry, strong reaction to HCl.
150		80	10	10	GW-GM	5YR6/3	S	Pink gravel with silt. As above except that gravel is fine, up to 1/2" maximum diameter and contains some an angular material.
156								First water. Free water is discharging from cyclone.
160		70	20	10	GW-GM	2.5YR 6/3	S	Light reddish brown gravel with silt and sand. Gravel clasts are up to 1" maximum diameter, angular to well-rounded, primarily reddish brown fine-grained sandstone with calcareous cement, arkosic sandstone, and phyllite, with lesser amounts of light to dark gray limestone, and a small amount of white tuff. Sand fraction is coarse through fine-grained with much coarse-grained; loose, saturated, strong reaction to HCl.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-3B**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
170	Basin Fill	70	20	10	GW-GM	2.5YR 6/3	M	Light reddish brown gravel with silt and sand. As above; a large component of the gravel is a reddish brown fine-grained sandstone with calcite cement and arkosic sandstone; other clasts include greenish sandstone, crystalline limestone, and white aphanitic to fine porphyritic volcanic tuff. Some calcareous silty sand cement coatings on pebbles. Moderate reaction to HCl.
180		65	30	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. Gravel clasts are up to 2" in diameter; angular to subrounded, composed of abundant arkosic sandstone and phyllite, with lesser limestone, white tuff, and trace feldspar porphyry. Few thin calcite-clay-silt cement coatings on weathered pebble surfaces. Sand is coarse to very fine-grained, composed of angular to subangular lithic grains of same composition as the gravel fraction. Moderate reaction to HCl.
190		65	30	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. As above, with abundant phyllite and arkosic sandstone with lesser reddish brown siltstone; increased amount of white tuff, with only trace amount of limestone in gravel fraction; some calcite-silt-sand coatings. Sand fraction contains abundant lithic grains of same composition; grains are angular to subangular, coarse to fine-grained.
200		65	30	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. As above, with abundant phyllite, white tuff, and sandstone, lesser amount of siltstone and quartz, and trace chert and limestone in the gravel fraction; few fine sandy calcite coatings. Sand fraction is as above.
210								Missed sample.
220		40	60	tr	SW	2.5YR 5/3	W	Reddish brown sand with gravel. Sample is ground up (due to drilling). Gravel clasts are mostly subrounded phyllite, quartz, white tuff, siltstone, arkosic sandstone, and trace limestone. Calcareous clay-silt-fine sand coatings on some clasts. Sand fraction is almost entirely lithic grains, coarse to fine-grained, but mostly angular coarse-grained. Weak to moderate reaction to HCl.
230		40	55	5	SW	2.5YR 5/3	W	Reddish brown sand with gravel. As above except that 60% of gravel clasts are white tuff, with lesser phyllite and quartz derived from the Pinal Schist, fine-grained sandstone, and siltstone. Clasts are up to 2" in diameter. Sand fraction is as above. HCl reactivity restricted to calcite-silt-sand cement coatings on clasts.
240		50	40	10	GW-GM	2.5YR 5/3	M	Reddish brown gravel with sand. Gravel ground during drilling process. Gravel clasts include white tuff (approximately 50%), reddish brown fine grained calcareous sandstone and siltstone, chert, pink quartzite, Pinal Schist phyllite and quartz, and trace gray limestone. Moderate reaction to HCl.
250		50	40	10	GW-GM	2.5YR 5/3	M	Reddish brown gravel with silt and sand. Gravel is comprised of approximately 35% white tuff, 35% Pinal Schist phyllite and metamorphic quartz, and 30% clastics including reddish brown and a little green sandstone, siltstone and arkosic sandstone.
260		55	35	10	GW-GM	2.5YR5/2 mottled	M	Weak red gravel with silt and sand. Gravel fraction contains approximately 40% Pinal Schist phyllite and metamorphic quartz, 30% reddish brown siltstone and sandstone, 10% greenish gray claystone, siltstone and fine grained sandstone, 15% white volcanic tuff, and 5% gray and trace yellow limestone. Calcite-sand coatings on some clasts.
270		15	75	5	SW	2.5YR5/1	M	Reddish gray sand with gravel. Sample is largely angular coarse sand-sized particles, probably developed during drilling of coarser material. Composition as above.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-3B**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
280	Basin Fill	55	40	5	GW	2.5YR5/2	W-M	Weak red gravel with silt and sand. Gravel composition differs from previous intervals in that the gravel clasts are mostly clastic sediments including reddish brown, greenish gray, and pale yellow sandstones, arkosic sandstone, and siltstones, accompanied by much lesser amounts of phyllite, tuff and limestone.
290		65	30	5	GW	2.5YR6/3 mottled	W-M	Light reddish brown gravel with sand. Gravel is angular to subrounded, but mostly angular; composed primarily of multi-colored clastic sedimentary lithologies as described in previous interval, with few Pinal Schist and volcanic tuff clasts. Sand is coarse to fine-grained, composed mostly of coarse lithic grains.
300		65	30	5	GW	2.5YR5/2	W	Weak red gravel with sand. Gravel clasts are up to 1/2' in diameter; mostly angular to subangular; composed of reddish brown siltstone, white quartz sandstone, greenish gray arkosic sandstone, pink sandstone, phyllite, quartz, white tuff, gray chert, and trace gray limestone. Clastic sedimentary clasts are most abundant with lesser phyllite and quartz, and little tuff. Calcite and rarely silica cement coatings are present on some clast surfaces. Sand is mostly coarse-grained with little medium and fine-grained material, poorly graded, composed mostly of lithic grains.
310		65	30	5	GW	2.5YR5/2	M	Weak red gravel with sand. As above.
320		75	20	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. Ground up (due to drilling action) mix of primarily reddish brown calcareous sandstone, light colored whitish and light through dark gray limestone, red, white and greenish colored, quartz sandstones, and dolomitic limestone.
330		75	20	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. As above; gravel clasts include angular to subrounded, up to 1" diameter reddish brown to gray siltstone and arkosic sandstone, gray to white fine-grained quartz sandstone, and trace amounts of phyllite, limestone, and tuff. Sand is mostly angular to subrounded coarse lithic grains with some quartz. Calcite-fine sand cement coatings are common.
340		75	20	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. As above; clasts are dominantly clastic sedimentary lithologies with about 30% derived from the Pinal Schist. White to pinkish calcite-sand cement coatings.
350		60	30	10	GW-GM	2.5YR 5/3	M	Reddish brown gravel with silt and sand. As above; gravel fraction contains approximately 50% Pinal Schist, abundant reddish brown fine-grained sandstone, siltstone, and arkose, with trace amounts of limestone and chert; lacks tuff seen in previous intervals. White calcite cement coatings common.
360		70	25	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. As above, with approximately 60% sedimentary and 40% Pinal Schist lithologies in the gravel fraction. Gravel is mostly angular with little subangular to subrounded material. Sand is poorly graded, mostly coarse-grained, but some medium and fine-grained material; composed mostly of lithic grains with lesser quartz. Some calcite cement coatings
370		70	25	5	GW	2.5YR 5/3	M	Reddish brown gravel with sand. As above.
380		60	30	10	GW-GM	2.5 YR 5/3	M	Reddish brown gravel with silt and sand. Lithologies in the gravel fraction include abundant reddish brown sandstone, quartzite, siltstone, and arkose, some yellow sandy limestone with small fossil shell fragments, and small amount of phyllite. Some calcite cement coatings.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-3B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
390	Basin Fill	40	50	10	SW-SM	2.5YR 4/2	M	Weak red sand with silt and gravel. Gravel fraction is as above, with increased amount of Pinal Schist to approximately 40%. Sand is coarse to fine-grained, but mostly coarse-grained, moderately well-graded, and composed almost entirely of lithic grains.
400		25	55	20	SC	2.5YR 7/2	M-S	Pale red clayey sand with gravel. Gravel is composed of white tuff, Pinal Schist, and sandstone clasts. Sand fraction is as above. Clay is sticky, cohesive, plastic.
401		75	25		GP	2.5YR 5/2	S	Weak red gravel with sand. Gravel is angular to subrounded, clasts are primarily reddish fine-grained sandstone with calcareous cement, some white limestone, and quartz.
410		30	60	10	SW-SM	5YR6/2	M	Pinkish gray sand with silt and gravel. Gravel clasts are up to 1/2" in diameter; subangular to subrounded; composed of 60% pink, brown, gray and white sandstone, arkosic sandstone, and siltstones, 30% white tuff, 10% phyllite, and trace gray limestone. Sand is mostly coarse lithic grains with smaller amount of medium to fine grains; fine-grained sand is mostly quartz.
418		15	15	70	CL	2.5YR 4/3	M	Reddish brown sandy clay with gravel. Gravel fraction is as above, with few light colored subrounded volcanics; sand fraction is coarse though fine-grained, clay is very soft, sticky, cohesive, plastic. Moderate reaction to HCl.
420		10	15	75	CL	2.5YR4/3	W	Reddish brown clay with sand. Small gravel fraction is composed of phyllite, white tuff, and clastic sedimentary clasts in approximately equal proportions. Weak reaction to HCl.
430		15	15	70	CL	2.5YR 4/3	M	Reddish brown clay with sand and gravel. Gravel and sand fraction are primarily broken up soft claystone, with some reddish fine- grained calcareous cemented sandstone, few quartz, and whitish limestone clasts. Clay is soft, sticky, cohesive, plastic. Moderate reaction to HCl.
440		25	35	40	CL	2.5YR 4/2	W-M	Weak red sandy clay with gravel. Gravel fraction contains 65% weak red mudstone, 30% Pinal Schist, and 5% white tuff. Clay comes out as balls during drilling and as a mix with sand and gravel-sized material. May be clayey rubble near the base of the basin fill.
445			10	90	CL	2.5YR 4/3	M	Reddish brown claystone fragments. Claystone is soft, slightly to moderately laminated, calcareous; about 25% of sample is as clay, soft, sticky, moderately plastic (appears to be derived from broken up claystone). Moderate reaction to HCl. Interpreted to be rubbly zone above the bedrock contact.
450		25	50	25	SC	2.5YR4/3	M	Reddish brown silty claystone fragments 75%; 25% other gravel clasts including tuff, phyllite, and sandstone. Claystone-rich rubble zone above the bedrock contact. Moderate reaction to HCl.
460		25	50	25	SC	2.5YR 4/3 2.5YR 4/4	M	Reddish brown silty claystone fragments with 25% other lithologies, as above. Claystone-rich rubble zone above the bedrock contact.
470	Cintura/ Morita				bedrock	2.5YR 6/3	M	Light reddish brown clay and claystone with some sand. Trace amount of gravel sized material is as fragments of claystone, siltstone, fine-grained sandstone, calcareous cemented claystone. Tabular, slightly laminated, fairly soft overall; clay is very soft, sticky, cohesive, moderately plastic; moderate reaction to HCl.

Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
480	Cintura/Morita Formation					2.5YR 6/3	M	Weak red claystone. Moderate reaction to HCl.
490						2.5YR 4/2 2.5YR5/2	M	Weak red silty claystone and clay, claystone is moderately indurated, slightly laminated; clay is very soft, sticky, cohesive; moderate reaction to HCl.
500						2.5YR 5/2	W-M	Weak red claystone, moderately indurated, very weakly laminated, slightly platy; small amount of free clay. Material is broken up during drilling due to its softness; weak to moderate reaction to HCl.
510						2.5YR 5/2	M	Weak red claystone. As above, with trace weak red clayey limestone.
520						2.5Y 7/2	S	Light gray mudstone. Abrupt color change to yellow hue; fairly soft, small amount of orangish brown limonite stain; strong reaction to HCl.
530						10 YR 5/2 7.5YR 5/3	M	Grayish brown sandstone and reddish brown mudstone. Mostly fine-grained, calcareous cemented sandstone, moderately hard; with smaller amount of reddish brown soft, slightly platy, calcareous mudstone. Moderate reaction to HCl.
540						10YR6/1	M	Gray mudstone, composed of indurated clay, silt and fine-grained sand. Moderate reaction to HCl.
550						2.5Y 7/3	M	Pale yellow mudstone and clay. Clay may be derived from grinding of the claystone during drilling; no recognizable bedding or laminations. Moderate reaction to HCl.
560						2.5Y 6/4	M	Light yellowish brown sandstone. Sandstone is fine-grained with calcareous cement; platy, weakly laminated, hard. Some softer reddish brown non-laminated mudstone, easily broken by hand, is also present in the sample. Moderate reaction to HCl.
570						2.5YR 5/2	M	Weak red claystone and clay; fairly soft. Clay is sticky, cohesive, plastic and constitutes approximately 50% of the sample. Moderate reaction to HCl.
580						10YR6/1	M	Gray mudstone, composed of very fine-grained sand, silt and clay; calcareous, fairly soft, slightly platy, weak laminations. Moderate reaction to HCl.
590						10 YR 6/4 2.5YR5/2	S	Light yellowish brown, silty to fine sandy limestone, with few shell fragments. Sample also contains approximately 20% reddish brown mudstone. Strong reaction to HCl. TD = 590 ft bls at 17:05 on 6/11/2008

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
0-10	Basin Fill	20	60	20	SM	5YR 6/4	W	Light reddish brown silty sand with gravel. Gravel clasts are up to 1/2" maximum diameter, subangular to well-rounded, composed of numerous quartzite, dark gray fine-grained sandstone, and volcanics. Sand fraction is coarse through very fine-grained, moderately well-graded through to silt. Loose, dry mix, very weak reaction to HCl.
20		80	10	10	GW-GM	5YR 6/4	S	Light reddish brown gravel with silt. Gravel clasts are angular to rounded, up to 1.5" diameter, primarily quartz, dark brown chert, pink sandstone and siltstone, and gray limestone. Many of the gravel clasts have calcareous coatings. Sand fraction is coarse through very fine-grained. Silt fraction is calcareous. Some caliche cement. Loose, dry mix, very strong reaction to HCl.
30			15	85	ML	5YR 6/4	S	Light reddish brown silt with sand, soft flour-like texture; sand fraction is fine to very fine-grained. Trace gravel is pale green feldspar porphyry, limestone, chert, and quartzite. Very strong reaction to HCl.
40		10	40	50	ML	7.5YR 4/4	S	Brown sandy silt. Gravel fraction is primarily light through dark gray limestone, with some white fine-grained sandstone. Sand fraction is medium through fine-grained but primarily fine-grained; silt fraction is calcareous. Small amount of caliche. Loose mix, very strong reaction to HCl
50		10	40	50	ML	7.5YR 4/4	S	Brown sandy silt. As described above. Gravel clasts include feldspar porphyry, phyllite, greenish to yellowish sandstone, limestone, and reddish brown quartzite. Little caliche.
60		20	50	30	SM	7.5YR 5/4	S	Brown silty sand with gravel. Gravel clasts are up to 1.5" diameter, subangular to well-rounded, composed primarily of dark through light gray limestone, arkose, sandstone, chert. Sand fraction is coarse through very fine-grained, moderately well-graded through to silt; silt fraction is calcareous. Loose, mix, very strong reaction to HCl.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-4B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
70	Basin Fill	80	10	10	GW-GM	7.5YR 5/4	S	Brown gravel with silt. Gravel clasts are up to 2" in diameter, subangular to rounded, primarily quartz, phyllite, quartzite, limestone, with some coarse to fine-grained calcareous sandstone. Sand fraction is very fine-grained; silt fraction is calcareous. Some caliche. Loose; strong reaction to HCl.
80		10	30	60	ML	5YR 6/4	S	Light reddish brown sandy, clayey silt. Gravel clasts are up to 1" in diameter, composed of mostly quartz, phyllite, volcanics, limestone, and fine-grained sandstone. Sand fraction is coarse through fine-grained; silt and clay fraction is soft, plastic, cohesive, calcareous. Moderate reaction to HCl.
90		10	30	60	ML	5YR 6/4	M	Light reddish brown sandy, clayey silt. As above.
100		10	40	50	ML	5YR 6/4	M	Light reddish brown sandy, clayey silt. As above, except that sand fraction has increased and gravel fraction is much finer, with a 1/2" maximum diameter.
110		50	30	20	GM	5YR 6/4	M	Light reddish brown silty gravel with sand. Gravel clasts are up to 1" maximum diameter, angular to rounded, composed of abundant white tuff, phyllite, quartz, limestones, and fine-grained sandstones. Sand fraction is coarse through very fine-grained, calcareous silt fraction contains some clay; loose mix; moderate reaction to HCl.
120		80	10	10	GW-GM	5 YR 6/4	S	Light reddish brown gravel with silt. Gravel clasts are up to 2" maximum diameter, subangular to well-rounded, composed primarily of white tuff, phyllite, limestone, fine-grained sandstones, and dark gray silicates. Sand fraction is medium through very fine-grained. Silt is calcareous; loose; strong reaction to HCl.
130		25	45	30	SM	5YR 6/4	S	Light reddish brown silty sand with gravel. Gravel fraction is as above. Sand fraction is coarse through fine-grained but is mostly coarse-grained; silt fraction is calcareous. Strong reaction to HCl.
140		50	25	25	GM	5YR 6/4	S	Light reddish brown silty gravel with sand. Gravel clasts are up to 1" maximum diameter, angular to subrounded, composed of abundant quartz, phyllite, medium and fine-grained sandstone with siliceous cement, fine-grained calcareous cemented sandstone; some sandstone clasts exhibit laminar structure. Sand fraction is coarse through fine-grained, moderately well-graded through to silt. Strong reaction to HCl.
150		40	35	25	GM	5YR 6/4	S	Light reddish brown silty gravel with sand; as above. Gravel clasts include abundant reddish brown siltstone, with lesser tuff, phyllite, quartz, and little limestone.
160		30	50	20	SM	5YR 6/4	M	Light reddish brown silty sand with gravel. Gravel fraction is fine, clasts are up to 3/4" maximum diameter, angular to subrounded, numerous quartz, phyllite, quartzite, medium to very fine-grained sandstones with calcareous and siliceous cement, some limestone, only trace tuff. Sand fraction is coarse through very fine-grained; silt fraction is calcareous. Moderate reaction to HCl.

		GR	**SA**	**Fl**				
165	Basin Fill	10	70	20	SM	5YR 6/4	M	First water at 165 ft bls. Light reddish brown silty sand; 10% gravel. Gravel fraction is as above. Sand fraction is very coarse through very fine-grained, well-graded through to silt; calcareous, moderate reaction to HCl.
170		60	20	20	GM	5YR 6/4	M	Light reddish brown silty gravel with sand. Gravel clasts are up to 2" maximum diameter, angular to subrounded, primarily phyllite and reddish brown siltstone, medium to fine-grained sandstone, many coated with caliche; some very weak laminations within the sandstones; numerous quartz and some dark through light gray limestone clasts. Sand fraction is very coarse through very fine-grained, well-graded through to silt. Moderate reaction to HCl.
180		60	20	20	GM	5YR 6/4	M	Light reddish brown silty gravel with sand, as above. Some calcite coatings on gravel clasts.
190		65	30	5	GW-GM	2.5YR 5/3	M-S	Reddish brown gravel with sand. Gravel clasts are subangular to subrounded, ≤ 2 cm diameter, polymictic composed of phyllite, metamorphic quartz, greenish gray fine grained quartz sandstone, dark reddish gray siltstone, white quartz sandstone with few opaques, green arkose, white tuff, gray limestone and chert. Sand is mostly coarse lithic grains. Calcite-clay-fine sand cement coatings on some clasts. Fines estimated, are washing out.
200		75	15	10	GW-GM	2.5YR 6/3	M	Reddish brown gravel with silt and sand. Clasts are 1/2 - 4 cm, occasionally coarser; mostly subangular with some subrounded; composed primarily of phyllite and quartz derived from the Pinal Schist, light colored sandstones, and dark siltstones, with lesser limestone, calcite-fine sand-clay cement coatings are common.
210		75	15	10	GW-GM	2.5YR 6/3	M	Light reddish brown gravel with silt and sand. As above, dominantly Pinal Schist and sandstone with lesser limestone, calcite-sand cement.
220		25	65	10	SW-SC	2.5YR 5/3	W	Reddish brown sand with clay and gravel. Sand is coarse to fine-grained, composed of lithic grains and quartz. Coarse sand is mostly lithic grains; fine sand is mostly quartz. Gravel is subangular to rounded; ≤ 1 cm, phyllite, quartz, sandstone, siltstone, and little limestone.
230		70	20	10	GW-GM	2.5YR 5/3	W	Reddish brown gravel with clay and sand. Gravel is primarily Pinal Schist phyllite and quartz, sandstone, and little limestone. Few calcite-sand cement coatings. Gravel clasts are up to 4 cm on long side. Sand is mostly coarse lithic grains.
240		80	20	tr	GW	2.5YR 5/2	W	Weak red gravel with sand. Gravel clasts are angular to subrounded, up to 4 cm, composed of phyllite and quartz derived from the Pinal Schist, sandstones, reddish brown siltstone, and trace pink feldspar porphyry. Moderate calcite-clay-sand cement coatings. Sand is mostly lithic grains.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-4B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
250	Basin Fill	55	40	5	GW	2.5YR 5/3	W	Reddish brown gravel with sand. Gravel clasts are angular to subrounded, up to 3 cm, composed of Pinal Schist, arkosic sandstone, greenish fine-grained quartzite, little limestone and trace volcanics. Sand is coarse to fine-grained, composed of lithic grains, quartz, and trace magnetite.
260		70	25	5	GW	2.5YR 5/3	W	Reddish brown gravel with sand. Gravel clasts are angular to rounded, up to 3 cm, composed primarily of Pinal Schist (phyllite, schist, metamorphic quartz), various sandstones and siltstone with little limestone. Cement coatings composed of clayey carbonate and sand. Sand as above.
270		55	40	5	GW	2.5YR 5/3	W	Reddish brown gravel with sand. Gravel clasts are up to 3 cm, angular to subangular, few small subrounded; composed of mostly Pinal Schist with lesser green, white and gray sandstone and trace limestone and white aphanitic volcanic. Sand is coarse to fine grained, largely lithic grains. Intergrown calcite, clay, and sand cement.
280		88	10	2	GW	2.5YR 5/2	W	Weak red gravel. Gravel clasts include gray and yellow limestone, Pinal Schist (phyllite, schist, metamorphic quartz) and fine-grained sandstones and quartzite in approximately equal proportions. Calcite-sand, clay cement coatings are common. Clasts are angular to subrounded, up to 4 cm. Fines washed out; well making 7,300 gpm.
290		83	15	2	GW	2.5YR 5/3	W	Reddish brown gravel with sand. Clasts include Pinal Schist, green fine-grained quartzite, gray sandstone, with trace limestone and white aphanitic volcanic. Clasts are angular to subrounded, up to 2.5 cm; moderate amount of calcite-fine sand cement. Sand is poorly graded, mostly fine and coarse-grained, composed of lithic grains and quartz.
300		55	45	tr	GW	2.5YR 5/2	W	Weak red gravel with sand. Gravel is angular to rounded, mostly ≤ 1 cm diameter, with sandy calcite cement coatings; composed of mostly Pinal Schist and white feldspathic sandstone, with little green quartzite yellow limestone and trace volcanic and siltstone. Sand is coarse to fine, mostly lithic grains. Calcite-sand coatings.
310		55	45	tr	GW	2.5YR 5/3	W	Reddish brown gravel with sand. Gravel is mostly angular and subangular with some subrounded, ≤ 1.5 cm diameter, mostly Pinal Schist with lesser clasts and little limestone. Sand is fine to coarse, composed mostly of lithic grains; some generated by drilling process.
320		5	85	10	SW-SM	2.5YR 6/2	M	Pale red sand with silt. Sand is coarse to very fine-grained, composed of lithic grains are Pinal Schist and clasts primarily. Changed from Stratex system to reverse circulation drilling with 9 7/8" tricone due to higher volume of water.
330		55	45	tr	GW	2.5YR 5/2	M	Weak red gravel with sand. Gravel is angular to rounded ≤1 cm diameter, composed of Pinal Schist, gray sandstones and trace siltstone; few calcite-sand cement coatings. Sand is medium to coarse-grained, mostly lithic grains.
340		65	35	tr	GW	2.5YR 5/3	W-M	Reddish brown gravel with sand. Clasts are angular to subrounded, up to 2 cm; composed of Pinal Schist and sandstones with lesser limestone (gray and yellow) and trace tan feldspar porphyry. Sand is medium to coarse, mostly lithic grains calcite-sand coatings on gravel clasts.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-4B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
350	Basin Fill	55	40	5	GW	10 R 5/3	M	Weak red gravel with sand. Gravel clasts are ≤1 cm diameter, angular to subangular, 50/50 Pinal Schist/sandstone; few calcite sand coatings. Sand is coarse to fine-grained, composed of lithic grains in the coarse fraction and mostly quartz in the fine fraction.
360		60	35	5	GW	10YR 5/2	M	Weak red gravel with sand. Gravel clasts are up to 1.5 cm, angular to subrounded, mostly Pinal Schist and green and gray sandstones with little limestone and siltstone; weak calcite cement coatings. Sand as above.
370		55	40	5	GW	10YR 5/3	M	Weak red gravel with sand. As above.
380		55	40	5	GW	10YR 5/3	M	Weak red gravel with sand. As above. At least some coarse sand is probably being created during drilling process, as much of the sand sized particles are fresh-surfaced angular lithic grains.
390		60	35	5	GW	10YR 5/2	W	Weak red gravel with sand. Gravel is angular to subrounded, up to 2 cm, primarily sandstones and Pinal Schist with little gray limestone and siltstone. Few calcite and calcite-sand cement coatings. Sand as above.
400		40	55	5	SW	10YR 5/2	M	Weak red sand with gravel. Gravel composition as above. Sand is coarse thru very fine-grained composed of lithic grains and quartz; some of the sand sized particle are probably generated during drilling. Original gravel content maybe higher. Few calcite-sand cement coatings.
410		40	55	5	SW	10YR 5/2	M	Weak red sand with gravel. As above, same lithologic composition; weak calcite-sand cement coatings on few clasts.
420		40	55	5	SW	10YR 5/2	W	Weak red sand with gravel; as above.
430		40	55	5	SW	5YR 5/3	W-M	Reddish brown sand with gravel. Fines are reddish brown; sand is mottled with abundant weak red tones. Gravel consists of green quartz sandstone, white sandstone, Pinal Schist, buff oolitic shelly limestone, trace red chert. Sand is fine to coarse-grained lithic grains and quartz; some is probably ground-up gravel clasts.
440		30	65	5	SW	2.5YR 5/3	W	Weak red sand with gravel. Gravel clasts include Pinal Schist (phyllite and metamorphic quartz), gray limestone, reddish brown arkose and sandstone. Sand is fine to coarse-grained with abundant coarse angular to subrounded lithic grains. Fine sand and fines wash out of samples.
450		45	50	5	SW	2.5YR 5/2	W-M	Weak red sand with gravel. Gravel clasts are up to 2 cm; angular to subangular, composed primarily of Pinal Schist with lesser sandstones and trace limestone. Sand is fine to coarse-grained, with abundant lithic grains.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-4B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**

460	Basin Fill	15	80	5	SW	2.5YR 5/2	W	Weak red sand with gravel. Gravel clasts are up to 1.5 cm, angular to subrounded sandstone, quartzite arkose with lesser phyllite. Sand is fine to coarse quartz and lithic grains.
470		15	75	10	SW-SM	2.5YR 5/2	W	Weak red sand with silt and gravel. Gravel clasts are subangular, ≤ 1 cm, composed of Pinal Schist, oolitic shelly limestone, sandstone and arkose. Sand is fine to coarse, composed of lithic grains and quartz. Trace calcite cement.
480		30	60	10	SW-SM	2.5YR 5/2	W-M	Weak red sand with silt and gravel. Gravel clasts are up to 2 cm, angular to subrounded, composed of abundant light colored sandstones with lesser Pinal Schist and little limestone. San as above. Trace calcite cement coatings.
490		55	40	5	SW	2.5YR 5/2	W	Weak red gravel with sand. Gravel clasts are up to 2 cm, angular to subangular, composed of phyllite to quartz derived from the Pinal Schist, light colored sandstones and gray chert. Sand is fine to coarse with abundant lithic grains and quartz. Few calcite cement coatings.
500		25	65	10	SW-SM	2.5YR 5/2	W	Weak red sand with silt and gravel. Gravel clasts are up to 1.5 cm, angular to subrounded, composed mostly of light colored sandstones with little quartzite and Pinal Schist. Sand is mostly lithic grains and quartz, fine to coarse grained. Trace calcite cement coatings.
510		25	65	10	SW-SM	2.5YR 5/2	M	Weak red sand with silt and gravel. Gravel clasts are up to 2 cm, angular to subrounded, composed of phyllite, quartz from Pinal Schist, gray limestone, arkose, quartzite, and siltstone. Sand as above. Trace calcite cement coatings.
520		45	50	5	SW	2.5YR 5/2	M	Weak red sand with gravel. Gravel clasts are angular to subrounded, ≤ 2 cm, composed of sandstone, arkose quartzite, with lesser phyllite, gray limestone, and chert. Sand is fine to coarse-grained, with abundant coarse lithic grains. Few calcite cement coatings.
530		25	70	5	SW	10 R 5/2	W-M	Weak red sand with gravel. Gravel clasts are ≤ 2cm, grading to coarse sand; angular to subrounded, composed primarily of phyllite and quartz derived from the Pinal Schist with little sandstone and red siltstone. Few calcite coatings. Sand as above.
540		20	75	5	SW	10 R 5/2	W	Weak red sand with gravel. Gravel clasts are ≤ 2 cm, angular to subangular composed mostly of quartz and phyllite from the Pinal Schist with lesser sandstone, quartzite and red siltstone. Sand is coarse to fine-grained well-graded through to silt, composed of quartz and lithic grains. Few calcite coatings.
550		20	75	5	SW	10 R 5/2	W	Weak red sand with gravel. Gravel clasts are ≤ 2 cm, angular to subrounded, composed of Pinal Schist material, sandstone and little gray chert. Sand as above. Few calcite-sand cement coatings.
560		30	65	5	SW	6 R 5/2	W	Weak red sand with gravel. Gravel is fine, ≤ 2 cm clasts, Pinal Schist-derived material, quartzite, and sandstone. Sand is fine to coarse-grained, well graded, composed of lithic grains and quartz.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-4B**

570	Basin Fill	15	75	10	SW-SM	2.5YR 5/3	W	Reddish brown sand with silt and gravel. Gravel is fine ≤ 1 cm in diameter, composed of phyllite and quartz derived from the Pinal Schist, reddish brown siltstone and sandstone, and little gray sandstone. Sand is coarse to fine-grained, well-graded through to silt, mostly lithic grains with some quartz. Few calcite coatings on gravel clasts.
580		25	65	10	SW-SM	2.5YR 5/3	W	Reddish brown sand with silt and gravel. Gravel fraction is mostly ≤ 1 cm with few coarser clasts, angular to subangular composed primarily of phyllite and abundant quartz derived from the Pinal Schist with lesser reddish brown sandstone and siltstone. Sand is coarse to fine-grained composed largely of lithic grains with some quartz; well-graded through silt. Few calcite coatings.
590		20	80		SW	2.5YR 5/3	W	Reddish brown sand with gravel. Gravel fraction to 1" max diameter, angular to subangular; quartz, phyllite, medium to fine-grained sandstone with calcareous cement, quartzite, small amount of dark gray schist, trace limestone. Sand fraction is very coarse through medium-grained but is primarily coarse-grained, some may be ground up gravels due to drilling action as the grains are very angular and appear to be fresh; sand is primarily quartz and sandstone fragments, some schistose material, weak reaction with HCl; saturated.
600		20	80		SW	2.5YR 5/3	W	As above.
610		20	80		SW	2.5YR 5/3	W	As described above, identical in appearance. Gravel clasts are quartz, phyllite, quartzite, sandstone, and trace limestone.
620		20	80		SW	2.5YR 5/3	W	As above.
630		20	80		SW	2.5YR 5/3	W	As above.
636	Mural Limestone				bedrock	2.5Y 7/2	S	Light gray limestone, (probably Cretaceous Mural Limestone) moderately laminated, platy, fairly hard, small amount of a fine grained reddish brown sandstone, calcareous cemented, strong reaction to HCl, saturated conditions.
640						2.5Y 7/2	S	As above.
650						10YR 7/1	S	Light gray limestone, slightly platy, fairly hard, few reddish brown sandstone inclusions within limestone. Very strong reaction to HCl, saturated conditions.
660						10YR 7/1	S	As above.

0	Basin Fill	5	10	85	ML	7.5YR 4/4	S	Brown silt, with 10% sand and trace gravel. Gravel is composed of quartz and dark through light gray limestones. Sand fraction is very fine-grained. Material is soft, powdery, loose; strong reaction to HCL.
10		5	10	85	ML-CL	7.5YR 6/4	S	Light brown caliche. Gravel and sand fractions are as described above; with calcareous caliche cement, fairly soft material, dry, very strong reaction to HCL.
20		5	20	75	ML-CL	7.5YR 6/4	S	Light brown caliche. Sand fraction is medium to very fine-grained, calcareous caliche cement; fairly soft, ground to a flour-like powdery texture during drilling. Trace gravel is sandstone and quartz; material is dry; very strong reaction to HCL.
30			25	75	ML-CL	7.5YR 7/3	S	Pink silt with sand, caliche. Soft, homogenous, ground to a gritty powdery texture during drilling; dry, very strong reactions to HCL.
40		5	45	50	CL	7.5YR 7/3	S	Pink sandy silt, caliche. As above; trace gravel. Sand is composed of quartz and limestone lithic grains.
50			25	75	CL	7.5YR 7/3	S	Pink silt with sand, caliche. As above.
60			25	75	ML	7.5YR 6/4	S	Light brown silt with sand, caliche. Sand fraction is coarse through very fine- grained; material is fairly soft, dry; very strong reaction to HCL.
70		15	15	70	ML	7.5YR 5/3	S	Brown sandy silt with gravel. Gravel is composed of angular to subrounded gray limestone with trace quartzite and arkosic sandstone. Sand fraction is fine to very fine-grained, silt is slightly indurated, soft, dry, strong reaction to HCL.

		GR	**SA**	**FI**				
80		30	20	50	ML	7.5YR 6/3	S	Light brown gravelly silt with sand. Gravel fraction to 1/2" max. diameter, angular to subrounded, primarily quartz, reddish fine-grained sandstone, and dark through light gray sandstone; sand fraction is coarse through fine-grained, loose mix, dry, strong reaction to HCL.
90			40	60	ML	2.5YR 5/3	S	Reddish brown sandy silt. Sand fraction is coarse through very fine-grained, fairly well-graded through to silt fraction, powdery, loose mix, very strong reaction to HCL.
100		75	15	10	GP-GM	2.5YR 5/3	S	Reddish brown gravel with silt and sand. Gravel clasts are up to 2" max. diameter, angular to subrounded, primarily a mix of quartz, gray limestones, medium to very fine-grained sandstone with calcareous cement, sandy siltstone and siltstone; mottled coloration includes reds, whites, and various shades of gray; sand fraction is coarse through fine-grained but primarily coarse-grained, dry loose mix, strong reaction to HCL.
110		2	48	50	ML	2.5YR 5/3	S	Reddish-brown sandy silt with trace gravel. Gravel fraction is as described above; sand is medium through very fine-grained but is primarily fine to very fine-grained; loose dry mix, very strong reaction to HCL.
120	Basin Fill	20	40	40	SM	2.5YR 5/3	S	Reddish-brown silty sand with gravel. Gravel clasts are up to 3/4" max. diameter, angular to subrounded, mostly reddish fine-grained sandstone with siliceous cement, some calcareous sandstone, gray limestone, silty sandstones and quartz; loose mix, dry; strong reaction to HCL.
130		10	30	60	ML	2.5 YR 5/3	S	Reddish brown sandy silt; 10% gravel. Gravel fraction is as above; sand fraction is fine to very fine-grained, powdery, loose, dry; strong reaction to HCL.
140		30	30	40	ML	2.5YR 5/3	S	Reddish brown sandy silt with gravel. Gravel clasts are up to 1" diameter, angular to rounded, a mix of quartz, sandstones, silty medium to fine-grained sandstone, and gray limestone; some gravel clasts have calcite coatings. Sand fraction is very coarse through very fine-grained, moderately well-graded through to silt; loose mix, dry, strong reaction to HCL.
150			40	60	ML	2.5YR 5/3	S	Reddish brown sandy silt. Sand fraction is medium to very fine-grained but mostly fine-grained. Silt has powdery texture, dry; strong reaction to HCL.
160		30	30	40	ML	2.5YR 5/3	S	Reddish brown sandy silt with gravel. Gravel clasts are up to 3/4" max. diameter, angular to subrounded, mix of schist, fine and medium-grained siliceous-cemented sandstones, some limestones, and quartz. Sand fraction is coarse through very fine-grained but is primarily finer grained material, loose mix, slightly wet, strong reaction to HCL.
Water								Intercepted first water at 160 ft bls.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-5M**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
170	Basin Fill	75	15	10	GP-GM	Mottled	M	Mottled gravel with silt and sand. Coloration includes grays, reds, whites, greens; gravel clasts are mostly very fine through medium-grained sandstone with some schist and quartz, up to 3/4" in diameter, angular to subrounded. Sand fraction is coarse through fine-grained but primarily coarse-grained; material is loose, saturated. Moderate reaction to HCL.
180		30	55	15	SM	2.5YR 5/4	M	Reddish brown silty sand with gravel. As above except that gravel fraction has decreased and sand fraction has increased, sand is primarily coarse-grained, loose, moderate reaction to HCL.
190		70	25	5	GP	Mottled	M/S	Mottled gravel with sand. Coloration includes reds, grays, whites, light green; gravel clasts are up to 2" max. diameter, primarily dark through light gray, white, and pale green limestones, reddish medium through fine-grained sandstone, quartz, and few schist clasts; subangular to rounded. Sand fraction is coarse through fine-grained, moderately well-graded through silt fraction, fairly clean, loose, moderate reaction to HCL.
200		70	25	5	GP	Mottled	M/S	Mottled gravel with sand. As above; colors are mostly reddish brown, light reddish brown and grays. Calcite-sand cement coatings. Moderate reaction to HCl
210		70	25	5	GP	Mottled	M	Mottled gravel with sand. As above. Calcite-fine sand cement coatings on few clasts. Moderate reaction to HCl.
220		70	25	5	GP	Mottled	M	Mottled gravel with sand. As above. Gravel is angular to rounded with few calcite-sand cement coatings. Moderate reaction to HCl.
230		70	25	5	GP	Mottled	M	Mottled gravel with sand. As above; few calcite-sand cement coatings. Moderate reaction to HCl.
240		80	20		GP	Mottled	M	Mottled gravel with sand. Coloration includes reds, whites, grays, pale green; gravel to 3" max diameter, angular to rounded, primarily limestones, sandstones (with calcareous and siliceous cement, medium to fine-grained, hard), few quartz. Sand fraction is coarse through fine-grained but primarily coarse-grained, loose mix, moderate reaction to HCL.
250		60	40		GP	Mottled	M	Mottled gravel with sand as described above except that gravel fraction is not as coarse with clasts to 1.5" max. diameter, but mostly less that 1/2" in diameter. Rounded surfaces on pebbles. Sand fraction has increased slightly, mostly coarse to very coarse-grained, clean. Moderate reaction to HCL.
260			90	10	SP-SM	5YR 5/3	S	Reddish brown sand with silt. Sand fraction is very coarse through medium-grained but is primarily coarse-grained, loose, fairly clean; strong reaction to HCL.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-5M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
270	Basin Fill	10	85	5	SP	7.5YR 7/3	S	Pink sand; 10% gravel. Gravel clasts are up to 1/2" max. diameter, composed of limestone with lesser amounts of reddish siltstone and sandstone with calcareous cement, phyllite and quartz. Sand fraction is primarily angular to subrounded, very coarse-grained with some finer material, composed of abundant quartz and lithic grains; loose, clean, very little fines. Strong reaction to HCL.
280		10	85	5	SP	7.5 YR 6/3	S	Light brown sand. As above except that material is finer grained overall, but still mostly coarse sand. Some yellowish limestone clasts are present as well as the lithologies listed above. Strong reaction to HCL.
290	Morita Formation				bedrock	5YR 5/4	S	Light reddish brown sandstone with yellowish fine-grained sandstone and limestone. Sandstone is silty, fine-grained, moderately soft, with calcareous cement. Limestone is pale yellow, crystalline. Strong reaction to HCL. Bedrock, Morita Formation.
300						2.5YR 5/4	S	Reddish brown sandy siltstone. Calcareous cement, fairly soft, some chips are platy. Strong reaction to HCL. Morita Formation.
310						2.5Y 7/3	M	Pale yellow sandstone, siltstone, clay stone with some clay. Distinct color change from above unit. Sandstone is very fine-grained with calcareous cement, moderately hard; siltstones and claystones are calcareous and fairly soft; small amount of soft, plastic, calcareous clay. Moderate reaction to HCL.
320						5Y 7/2	W	Light gray clay and sandstone. Sandstone is fine-grained, with calcareous cement, platy, friable, very weakly laminated. Clay is plastic, cohesive, sticky; sandstone and clay are probably as interbedded material. Weak reaction to HCL.
330						5Y7/2	W	Light gray sandstone; fine-grained, calcareous cement, slightly platy, fairly hard but can be broken with fingers; few black flecks, few shell fragments, moderate reaction to HCL.
340						5YR 7/2	W	Light gray clay and clayey sandstone, probably interbedded; as described for the 320' depth.
350						2.5Y 6/3	M	Light yellowish brown sandstone; fine-grained, calcareous cement, slightly platy, hard. Trace disseminated small black spots. Moderate reaction to HCL.
360						2.5Y 5/3	M	Light olive brown silty sandstone and siltstone; fine-grained, slightly platy, calcareous cement, fairly hard. Trace fossil shell fragments, few calcite veinlets and dendrites. Moderate reaction to HCL.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-5M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
370	Morita Formation					2.5Y 6/3	M	Light yellowish brown clay and claystone. Clay is soft, plastic, sticky, cohesive, calcareous; claystone is platy, very weakly laminated, moderately soft, easily broken by fingers, moderate reaction to HCL.
380						2.5Y 5/3	M	Light olive brown sandstone; fine-grained with calcareous cement, slightly platy, hard. Small amount of pale yellow sandy limestone and pinkish gray calcareous sandstone are also present. Moderate reaction to HCL.
390						2.5Y 5/3	M	Light olive brown sandstone; fine-grained with calcareous cement, slightly platy, hard. Moderate reaction to HCL.
400						2.5Y 6/3	M	Light yellowish brown clayey siltstone. Very fine-grained, silty sandstone with interbeds of clay and claystones, siltstones, and silty fine-grained sandstones. Claystones are very weak, laminated, fairly soft; silty sandstone are moderately hard, slightly platy; clay fraction is plastic cohesive sticky, soft; all are calcareous, and react moderately to HCL.
410						2.5Y 6/3	M	Light yellowish brown clay, claystone, and mudstone. Mudstone is composed of lithified clay, silt, and fine sand, and is weakly laminated, fairly soft, calcareous. Clay is plastic, cohesive, soft, calcareous. Moderate reaction to HCL.
420						2.5Y 6/3	M	Light yellowish brown sandstone; fine-grained, calcareous cement, slightly platy, fairly hard; few black flecks maybe free carbon. Weak orange-brown limonite stain on few fractures. Moderate reaction to HCL.
430						10 YR 7/6	M	Yellow silty sandstone, claystone, and clay interbeds as above; all are calcareous. Silty sandstone and claystone are soft, weakly laminated; clay is soft, moderately plastic. Few limonitic fractures; moderate reaction to HCL.
440						2.5Y 6/3	M	Light yellowish brown, fine-grained sandstone. Platy, calcareous cement; hard. Moderate reaction to HCL.
450						5Y 7/3	M	Pale yellow clay with small amount of fragmented sandstone; clay is plastic, cohesive, sticky, soft, calcareous. Moderate reaction to HCL.
460						5Y 7/3	M	60% pale yellow silty sandstone and claystone and 40% pink fine-grained sandstone with calcareous cement. Claystone is fairly soft, very weakly laminated; clay fraction is as described above. Moderate reaction to HCL. TD = 460 ft bls at 9:00 on 8/20/2008

0	Basin Fill		10	90	ML	7.5YR6/4	S	Light brown silt. Sand fraction is very fine-grained, loose, powdery, dry.
10		trace	15	85	ML	7.5YR6/4	S	Light brown silt with sand. Sand fraction is coarse to very fine-grained, composed of angular to subrounded quartz and lithic limestone and sandstone grains. Few gravel-sized clasts are caliche chunks and gray limestone.
15		trace	10	90	ML	5YR7/3	S	Pink silt. Sand fraction is very fine-grained, loose.
20		trace	10	90	ML	5YR6/4	S	Light reddish brown silt. Sand is coarse to very fine-grained quartz and lithic grains. Trace amount of gravel-sized material is composed of milky quartz clasts and caliche chunks.
27			20	80	ML	5YR7/3	S	Pink silt with sand; caliche cement. Very soft material. Sand fraction is coarse through very fine-grained.
30		trace	25	75	ML	7.5YR7/3	S	Pink silt with sand. Sand is angular to subangular limestone, jasperoid, and sandstone lithic grains and quartz grains. Few gravel-sized particles are limestone and chunks of caliche.
40			20	80	ML	5YR5/3	S	Reddish brown silt with sand; caliche cement, moderately soft. Sand is medium to fine-grained, composed of quartz grains and lithic sandstone and limestone grains.
50			15	85	ML	5YR6/3	S	Light reddish brown silt with sand; caliche cement. Mixed soft and slightly harder caliche layers. Harder layers break into lenticular pieces. Sand is medium to very fine-grained.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-6M**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
60	Basin Fill	trace	10	90	ML	7.5YR6/3	S	Light brown silt with sand; caliche cement; soft, loose, powdery material. Sand fraction is fine-grained, composed of free quartz grains, few sandstone and other lithic grains. Trace amount of gravel-sized particles are hard angular chunks of caliche and soft claystone.
70		trace	15	85	ML	7.5YR6/3	S	Light brown silty sand; caliche cement. Trace amount of gravel-sized particles are angular to subangular caliche chunks generated by drilling, gray sandstone, and gray limestone clasts.
75		5	45	50	ML	5YR6/2	S	Pinkish gray sandy silt; trace amount of gravel. Gravel is up to one inch in diameter, angular to subrounded, composed of dark gray schist and light gray to buff limestone. Sand fraction is fine to very fine-grained, weakly cemented.
80		10	60	30	SM	7.5YR6/3	S	Light brown silty sand. Gravel is composed of angular to subrounded clasts of medium to coarse-grained pink sandstone, white quartzite, fine-grained tan sandstone, gray limestone, and trace jasperoid; few clasts have with calcite and/or caliche coatings. Sand is angular to subrounded, coarse through very fine-grained, composed of abundant lithic grains and quartz.
90		5	10	85	ML	5YR6/3	S	Pinkish gray silt with sand; caliche cement. Small gravel fraction; gravel clasts are primarily limestone with some schist, quartzite, granitoids, and arkosic sandstone. Few partial calcite coatings on clasts. Material is fairly soft.
100		15	65	20	SM	5YR6/4	S	Light reddish brown silty sand with gravel. Gravel is up to 1/2" diameter, subangular to rounded, clasts are primarily dark to light gray limestone with lesser amount of gray sandstone and caliche chunks. Sand fraction is medium through very fine-grained, but mostly fine-grained, loose.
110		50	25	25	GM	5YR6/4	S	Light reddish brown silty gravel with sand. Gravel is primarily angular to subrounded, composed of light to dark gray limestone with lesser amount of gray sandstone, and trace granite clasts; few white calcite surface coatings. Sand is medium to very fine-grained but mostly fine-grained, loose.
120		25	50	25	SM	5YR6/3	S	Light reddish brown silty sand with gravel. Gravel is angular to subrounded, primarily dark to light gray limestone with little silicified limestone and phyllite; few calcite surface coatings. Sand fraction is medium through very fine-grained, but mostly fine-grained, moderately well-graded through to silt; loose.
130		10	50	40	SM	5YR6/3	S	Light reddish brown silty sand; 10% gravel. Gravel is composed of gray limestone, chert, arkose, phyllite, granitoid, fine-grained sandstone and siltstone. Sand is fine to very fine-grained. Material is loose, powdery.
140		25	45	30	SM	5YR6/3	S	Light reddish brown calcareous silty sand with gravel. Gravel is primarily dark to light gray limestone with some silicification, fine-grained maroon and gray sandstone, and trace granite. Sand is medium to very fine-grained, but mostly fine-grained.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-6M**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
150	Basin Fill	25	45	30	SM	5YR6/3	S	Light reddish brown calcareous silty sand with gravel. Gravel is composed of sandstone, gray limestone, silicified limestone, and small amounts of granitoid and phyllite; clasts are up to 1 cm diameter commonly with calicite-sand coatings. Sand is medium to very-fine grained, but mostly fine-grained.
160		25	45	30	SM	5YR6/3	S	Light reddish brown calcareous silty sand with gravel. As above.
170		25	45	30	SM	5YR6/3	S	Light reddish brown calcareous silty sand with gravel. Gravel is primarily silicified limestone, with gray limestone, pinkish stained phyllite, and fine-grained pink and gray sandstone; most clasts are subangular, some have calcite-sand coatings. Sand is medium to very-fine grained, but mostly fine-grained, composed of quartz and lithic grains.
180		25	45	30	SM	5YR6/3	S	Light reddish brown silty sand with gravel. Gravel clasts are angular to subangular, up to 3/4" diameter, composed of gray limestone with some silicification, maroon sandstone, and caliche chunks. Sand is medium to fine-grained, but mostly fine-grained, composed mostly of quartz with lesser amount of lithic grains. Medium sand grains are angular to subrounded; fine grains are subrounded to rounded.
190		25	45	30	SM	5YR6/3	S	Light reddish brown silty sand with gravel. Gravel fraction contains abundant clasts of pink, gray, green and brown sandstone with little gray limestone and quartzite. Calcite coatings on some clasts. Sand is coarse to very fine-grained, but mostly fine-grained. Coarser sand is dominantly lithic grains; finer sand is mostly quartz.
200		80	15	5	GW	Mottled	S	Mottled gravel with sand. Colors are dark through light grays, pinks, reds, and whites. Clasts are up to 1.5", subangular to rounded, primarily limestone with some sandstone, arkose, phyllite, and quartz, in matrix of calcareous sand and silt. Approximately 15% have thin white calcite surface coatings. First water, saturated.
220		70	10	20	GC	7.5YR6/3	S	Light brown clayey gravel. Gravel is composed of limestone, sandstone, a few jasperoid and quartzite clasts, and caliche chunks. Small sand fraction is coarse through very fine-grained. Fines are primarily clay; very soft, sticky, cohesive, and plastic.
230			20	80	CL	7.5YR6/3	S	Light brown clay and silt with sand. Sand is medium to very fine-grained; fines are a soft, sticky, cohesive clay and silt mix.
240	Morita Formation					10YR7/4 to 2.5Y7/4	S	Very pale brown to pale yellow fine-grained calcareous fossiliferous sandstone and little siltstone. Small amount of silt and clay.
250						2.5Y7/4	S	Pale yellow fine-grained arkosic sandstone and fossiliferous limestone.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-6M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**Fl**				
260	Morita Formation					2.5Y7/4	S	Very pale brown, pale yellow, reddish brown and gray fine-grained arkosic sandstone with a few gray mudstone chips. Rare < 1mm calcite-hematite microfracture fillings.
270						2.5Y8/3	M	Pale yellow, fine-grained, well-sorted arkosic sandstone with calcareous cement. Sand grains are mostly clear quartz with scattered white, red, and black grains. Few fine black oxide spots on partings. Morita Formation
280						2.5Y8/3	M	Pale yellow sandstone, as above.
290						2.5Y8/3	M	Pale yellow sandstone, as above. Few radial black manganese oxide dendrites.
300						2.5Y5/2	M	Pale yellow and reddish brown fine-grained, sandstone with calcareous cement.
307						2.5Y6/4	M	Light yellowish brown claystone. Soft, platy, weakly laminated.
308						2.5Y7/4	M	Pale yellow sandstone, fine-grained calcareous cement.
310						2.5Y7/3	M	Pale yellow arkosic sandstone with siltstone interbeds.
320						2.5Y7/4	M	Pale yellow silty sandstone, fine-grained calcareous cement.
330						2.5Y7/4	M	Pale yellow sandstone, fine-grained calcareous cement.
340						2.5Y7/4	M	Pale yellow with some light reddish brown fine-grained sandstone with calcareous cement. Reddish tones are imparted by weak hematite stain. Trace calcite veinlets. Formation is making approximately 250 gpm water.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-6M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
350	Morita Formation					2.5Y7/4	M	Pale yellow with some light reddish brown fine-grained sandstone with calcareous cement. Approximately 15% is reddish brown (5YR6/3) due to weak hematite stain. Trace amounts of hematite in tiny voids; small black oxide spots locally.
360						2.5Y7/4	M	Pale yellow and some light reddish brown fine-grained sandstone with calcareous cement, as above.
370						2.5Y7/2	M	Light gray sandstone, mudstone, and claystone. 70% fine-grained sandstone; 30% fine mudstone and claystone, probably as interbeds; fine sediments are weakly laminated, platy, soft.
380						2.5Y7/2	M	Light gray siltstone, sandstone, and claystone. 70% siltstone and mudstone, 30% very fine-grained sandstone; all calcareous. Fine sediments are weakly laminated, platy, soft.
390						2.5Y7/4	M	Pale yellow fine grained sandstone, moderately hard, calcareous cement. Localized pink hematite and gold limonitic stain; rare black oxide spots partings.
400						2.5Y7/4	M	Pale yellow fine-grained sandstone, moderately hard, calcareous cement, with minor amount of fairly soft, weakly laminated, light greenish gray claystone. Trace fine-grained disseminated black oxide and oxidized cubic pyrite; weak hematite stain on some fractures.
410						2.5Y7/4	M	Pale yellow fine-grained calcareous silty sandstone, gray to light greenish gray calcareous siltstone and claystone. Fine sediments are fairly soft, platy, weakly laminated, moderately soft.
420						10YR6/2	M	Light brownish gray fine-grained sandstone, calcareous cement, homogeneous. Weak limonitic stain on some fractures.
430						2.5Y6/2	M	Light brownish gray fine-grained sandstone, calcareous cement, homogeneous. Rare small dendritic manganese oxides.
440						10YR6/6	S	Brownish yellow crystalline limestone, locally silty and sandy; less than one foot thick bed; fairly hard. Moderate limonite stain, few black manganese oxide spots.
441						2.5Y6/2	M	Light brownish gray fine-grained sandstone, calcareous cement, homogeneous.

Depth (Ft)	Graphic Log	Estimated %			USCS Symbol	Munsell Color	HCl Rxn	Sample Description
		GR	SA	FI				
10	Basin Fill	50	30	20	GM	2.5YR7/3	S	Light reddish brown silty gravel with sand. Gravel fraction is composed of angular to subangular clasts and clast fragments, composed mostly of gray to grayish brown limestone, and white to gray phyllite with pinkish surface stain, pink to white quartz sandstone, and few silicified limestone, chert, and quartz clasts. Phyllite and some quartz clasts appear to be Pinal Schist. Sand fraction is primarily angular to subrounded, coarse to fine-grained, well-graded through to silt; composed of lithic grains, quartz, and trace fine magnetite. Moderately well-cemented with caliche.
20		15	45	40	SM	2.5YR6/4	S	Light reddish brown silty sand with gravel, moderately well-cemented with caliche. Gravel fraction is angular to subangular, comprised of abundant chunks of caliche generated during drilling. Gravel is composed of phyllite, pale colored sandstones, and limestone with some silicification. Sand fraction is as above.
30		65	15	20	GC	2.5YR8/3	S	Pink clayey gravel with sand, well-cemented with caliche. Material is hard, posing penetration difficulties for the ARCH method of drilling. Gravel and sand as above with abundant chips of caliche. Higher ratio of clay to silt in the fines fraction than above.
40		55	25	20	GC	2.5YR8/3	S	Pink clayey gravel with sand, as above. Material is sufficiently hard that ARCH drilling will be discontinued at this interval, and open hole tricone drilling will proceed until the caliche is fully penetrated.
50			75	25	SM	2.5YR5/4	S	Reddish brown silty sand, caliche cement. Sand is medium to fine-grained but mostly fine-grained, moderately well-graded through to silt; little clay, mostly silt in the fines fraction. Sand grains are angular to subrounded quartz and lithic grains. Material is hard due to caliche cement.
60		60	20	15	GC	2.5YR8/3	S	Pink clayey gravel with sand. Gravel is mostly angular to subangular clasts of gray, reddish, to white sandstone; also rare green sandstone with epidote matrix; some variably colored siltstones; and few gray limestone clasts. Sand fraction is coarse to fine grained, composed mostly of lithic grains with some quartz grains. Moderately to strongly cemented with caliche.
70		15	70	15	SM	2.5YR7/3	S	Light reddish brown silty sand with gravel. Gravel to 1 cm; coarse is angular; fine angular to subrounded; red, gray, and brown fine-grained sandstone and siltstone; rare angular silica and vein quartz. Sand coarse to fine, composed of lithic grains, quartz, and caliche. Moderate to strongly cemented.

Project Name: **Bisbee Mitigation**								Boring No.**: BMO-2008-7M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
80	Basin Fill	5	70	25	SC	2.5YR6/3	S	Light reddish brown clayey and silty sand. Sand fraction mostly fine with few coarse grains, poorly graded, composed of lithic grains, quartz, and caliche chips. Gravel pink, brown, gray to greenish fine-grained sandstone, red siltstone, rare green and yellowish brown siltstone, and few angular vein quartz chips. Moderate cementation.
90		5	55	40	SC	2.5YR6/3	S	Light reddish brown clayey sand. Rare gravel mostly angular to subrounded pink, brown, gray, and greenish fine-grained sandstone; little gray limestone, and rare brick red sandstone. Sand is multi-colored sandstone lithic grains with same composition as the gravel.
100		5	70	25	SC	2.5YR6/3	S	Light reddish brown clayey sand. Rare gravel is angular to subrounded, multi-colored sandstones, little gray limestone, rare brick red sandstone, trace phyllite and caliche. Sand fine to medium with rare coarse grains, poorly graded; lithic grains and quartz. Trace blue copper oxide chips. Few sandy clay balls.
110		15	60	25	SC	2.5YR6/3	M	Light reddish brown clayey sand with gravel. Gravel inferred and quantity estimated by drill rig performance. Gravel and coarse sand are angular to subangular and subrounded brown, gray, reddish and greenish fine-grained sandstone with a little siltstone and trace phyllite. Sand quartz and lithic grains of same composition.
120		15	60	25	SC	2.5YR7/3	S	Light reddish brown clayey sand with gravel, as above. Gray, brown, green, and white sandstone and siltstone with a little brownish gray limestone comprise gravel and coarse sand fraction.
130		15	45	40	SC	2.5YR7/3	S	Light reddish brown clayey sand with gravel. Gravel inferred and quantity estimated by drill rig performance. Gravel and coarse sand are mostly angular brown, gray, pink, and some white sandstone with minor siltstone, limestone and rare quartz-limonite vein fragments. Sand fine to coarse, mostly fine, moderately well-graded, composed mostly of lithic grains and chips of same composition as the gravel fraction.
140		tr	30	70	CL	2.5YR7/2	S	Pale red sandy clay. Sand is coarse to fine-grained, moderately well-graded through to silt. Few gravel-sized particles and most of the sand-sized particles are brown, gray, and white sandstone; reddish brown and green siltstone; trace amount of phyllite, and vein quartz. Few clay balls; clay is sticky, cohesive.
150		5	35	60	CL	2.5YR7/2	S	Pale red sandy clay. As above, with a few chloritic siltstone and epidotized green sandstone grains in addition.
160			20	80	CL	2.5YR7/2	S	Pale red clay with sand. Clay is sticky and cohesive. Sand fraction is mostly fine-grained; well-graded through to silt; composed of quartz, lithic grains, and trace magnetite.
170			40	60	CL	2.5YR6/3	S	Light reddish brown sandy clay, as above but with higher percentage of sand.
180			15	85	CL	2.5YR6/3	S	Light reddish brown clay with sand, as above with smaller sand to fines ratio.
190			30	70	CL	2.5YR6/3	S	Light reddish brown sandy clay. Sand is composed of fine-grained quartz, lithic grains, and trace magnetite.

Project Name: **Bisbee Mitigation**								Boring No.**: BMO-2008-7M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
200	Basin Fill		30	70	CL	2.5YR6/3	S	Light reddish brown sandy clay, as above.
210		80	10	10	GW-GC	2.5YR6/3	S	Light reddish brown gravel with clay. Gravel angular to subangular gray, brown, and locally greenish phyllite (Pinal Schist) with few sandstone and quartz clasts. Hard caliche surface coatings are present on some clasts. Sand is quartz and sand-sized sandstone and phyllite lithic grains; poorly graded; mostly coarse and very fine-grained.
216		80	10	10	GW-GC	2.5YR6/3	S	Light reddish brown gravel with clay, as above. Few caliche chips and coatings on gravel clasts. Material is damp, trace amount of water.
220		80	10	10	GW-GC	2.5YR6/3	S	Light reddish brown gravel with clay. Gravel clasts are angular to subrounded pinkish brown to greenish fine-grained sandstone, gray phyllite, milky to nearly clear quartz, small amount of gray limestone, siltstone, and arkose. Sand fraction is poorly graded, composed of coarse angular lithic grains and fine-grained quartz and lithic grains. Some silt as well as clay is present in fine fraction.
230		75	20	5	GW	2.5YR6/3	S	Light reddish brown gravel with sand. Color logged is that of the fines coating the gravel; gravel clasts themselves are darker and multicolored. Gravel is comprised of gray to brown sandstone, siltstone, and phyllite clasts. Sand is primarily lithic grains of same composition as gravel with some quartz grains. Formation began making water at approximately 235' bls.
240		85	10	5	GW	2.5YR6/3	S	Light reddish brown gravel. Coarse gravel zone. Gravel clasts are angular broken chunks to subangular clasts up to 3cm on the long side composed of green to brown fine-grained sandstone, phyllite and metamorphic quartz derived from the Pinal Schist, with few siltstone clasts. Few clasts have caliche and/or calcite surface coatings.
250		50	45	5	GW	2.5YR7/3	S	Light reddish brown gravel with sand. Gravel is as described in the previous interval. Sand is mostly coarse-grained lithic fragments and grains of the same composition as the gravel. HCl reactivity is restricted to the fine fraction and carbonate coatings.
260		60	35	5	GW	2.5YR7/2	M	Pale red gravel with sand. Gravel is angular to subrounded; gravel and most sand-sized particles are mostly brownish with a little greenish sandstone, grayish brown phyllite, and quartz. Sand is largely coarse grained. Caliche cement coatings are present on a few clasts. HCl reactivity restricted to fine fraction and the caliche.
270		75	20	5	GW	2.5YR6/3	M	Light reddish brown gravel with sand, as above. Sand is comprised mostly of coarse sand-sized lithic fragments and grains of the same composition as the gravel.
280		25	65	10	SW-SM	2.5YR6/3	S	Light reddish brown sand with silt and gravel. Gravel is as above with a few clasts of siltstone in addition. Sand is mostly medium to coarse-grained, composed of lithic grains and quartz. A few grains have caliche coatings.
290		65	30	5	GW	2.5YR6/3	S	Light reddish brown gravel with sand. Gravel is comprised of gray, brown, greenish sandstone, siltstone, and phyllite (Pinal Schist) clasts. Sand is coarse to fine-grained, composed of lithic and quartz grains.
300		75	20	5	GW	2.5YR5/2	M	Weak red gravel with sand. Gravel is angular to subangular, composed of gray to grayish brown sandstone and siltstone, with some green siltstone, grayish brown phyllite, and metamorphic quartz clasts. Sand is poorly graded, comprised mostly of coarse sand-sized lithic grains, with trace magnetite. Approximately 20% of the gravel clasts have crystalline calcite cement coatings. HCl reaction is confined to the fine fraction and calcite cement.

Project Name: **Bisbee Mitigation** Boring No.**: BMO-2008-7M**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
310	Basin Fill	70	20	10	GW-GM	2.5YR5/2	M	Weak red gravel with silt and sand. As above, with slight increase in fines.
320		70	25	5	GW	2.5YR5/2	W	Weak red gravel with sand. Gravel is angular to subangular, coarse to 3 cm; gray, brown, greenish and white fine to medium grained sandstone and siltstone, with grayish brown phyllite, and quartz, brown siltstone, and rare oolitic limestone clasts, 20% have calcite-fine sand surface coatings. Sand well-graded, coarse to fine, lithic grains and quartz.
330		30	65	5	SW	2.5YR5/2	W	Weak red sand with gravel. Gravel is angular to subrounded, to 1 cm in; phyllite, schist and metamorphic quartz clasts with light to dark gray, brown, and dull green sandstone and siltstone. Limonite and manganese oxides on microfractures in sandstone clasts. Sand well-graded, fine to coarse; lithic grains, quartz, and trace magnetite.
340		30	65	5	SW	2.5YR5/2	W	Weak red sand with gravel. Gravel angular to subangular; phyllite, metamorphic quartz, with light to dark gray, brown, and dull green sandstone, greenish siltstone, trace gray chert or jasperoid. Sand well-graded, coarse to fine, subrounded lithic and quartz grains with trace fine-grained magnetite.
350		65	30	5	GW	2.5YR5/1	W	Reddish gray gravel with sand. Gravel and coarse sand-sized particles are primarily schist, phyllite, and metamorphic quartz with lesser amount of gray, brown, and dull green sandstone and little brown calcareous siltstone clasts with surface coatings of calcite and fine sand. Sand fraction well-graded; coarse to medium, lithic grains, quartz and trace magnetite.
360		70	25	5	GW	2.5YR6/1	M	Reddish gray gravel with sand. Gravel subangular to angular, to 1 cm phyllite, schist, and metamorphic quartz, with gray, pinkish brown, white, and dull green fine to medium-grained sandstone; brown calcareous siltstone; and calcite-limonite altered silty limestone. Sand coarse to fine, angular to subrounded, well-graded; coarse mostly lithic, fine mostly quartz with trace magnetite.
370		55	30	15	GC	2.5YR6/2	M	Pale red clayey gravel with sand. Gravel clasts are dominantly Pinal Schist as above, with lesser clastics. Sand is as above. HCl reaction is confined to the fines fraction, calcite coatings on clasts, and the few calcareous sandstone and siltstone clasts.
380		35	55	10	SW-SM	2.5YR6/3	M	Light reddish brown sand with silt and gravel. Gravel clasts are angular to subangular, dominantly Pinal Schist as above with lesser amount of sandstone clasts. Sand fraction is coarse to fine-grained, well-graded. Coarse sand-sized particles are mostly lithic grains; finer sand is quartz with trace magnetite.
390		50	40	10	GW-GM	2.5YR6/3	M	Light reddish brown gravel with silt and sand. Gravel is angular to subangular, composed almost entirely of Pinal Schist clasts (phyllite, schist and metamorphic quartz) with little sandstone; few calcite surface coatings. Sand fraction as above.
400		40	55	5	SW	2.5YR5/2	M	Weak red sand with gravel. As above but with fewer fines and increased sand fraction.
410		20	75	5	SW	2.5YR5/3	W	Reddish brown sand with gravel. Gravel continues to be largely composed of Pinal Schist with lesser sandstone, as above. Sand is coarse to fine-grained, moderately well-graded, composed of angular to subrounded quartz and lithic grains with trace magnetite.
420		65	30	5	GW	2.5YR5/2	W	Weak red gravel with sand. Gravel angular to subangular, to 2 cm, schist, phyllite, and metamorphic quartz with pinkish brown fine-grained sandstone, and few green siltstone clasts. Some caliche surface coatings. Sand coarse to fine, well-graded, quartz, lithic grains, and trace magnetite.

Project Name: **Bisbee Mitigation**								Boring No.**: BMO-2008-7M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
430	Basin Fill	40	55	5	SW	2.5YR5/3	M	Reddish brown sand with gravel. Gravel is as above. Sand is coarse to fine-grained, but mostly medium-grained, well-graded, composed mostly of subangular to subrounded quartz with some lithic grains.
440		70	25	5	GW	2.5YR5/3	W	Reddish brown gravel with sand. Gravel is up to 2 cm on a long side, angular to subangular, mostly pinkish brown to gray Pinal Schist clasts, with lesser amounts of light pink to light gray sandstone. Sand is coarse to fine-grained but mostly subangular coarse lithic grains with lesser quartz. Calcite cement with fine sand coatings are present on some gravel clasts.
450		55	40	5	GW	2.5YR5/3	W	Reddish brown gravel with sand. Gravel angular to subangular, primarily pinkish brown to gray Pinal Schist with light pink to light gray sandstone, and trace granite. Sand coarse to fine but mostly medium, subangular to subrounded, quartz with lithic grains and trace magnetite.
460		30	65	5	SW	7.5YR5/2	W	Brown sand with gravel. As above with greater sand to gravel ratio. Color change from reddish brown to brown.
470		55	35	10	GW-GM	7.5YR6/3	M	Light brown gravel with silt and sand. Gravel pea-sized (< 1 cm), angular to subrounded; clasts of Pinal Schist with fine-grained arkose, quartz sandstone, little siltstone, and trace rhyolite. Sand well-graded, coarse to fine, coarse sand is subangular lithic grains, medium subrounded quartz and lithic grains grading to subrounded fine quartz sand.
480		40	55	5	SP	7.5YR6/3	S	Light brown sand with gravel. Gravel subangular, white, gray, and pinkish sandstone; brown, pinkish, and gray siltstone; little phyllite; and trace metamorphic quartz. Sand coarse to fine, mostly coarse, poorly graded. Coarse sand mostly lithic grains; fine sand mostly quartz with few lithic grains and trace magnetite.
490	Morita Formation					2.5YR6/1	S	Bedrock. Reddish gray calcareous clayey siltstone, Morita Formation. Fine-grained black flecks may be carbon. Trace reddish gray fine-grained arkosic sandstone present as well. Formation is soft; the ARCH casing sinking into the formation under its own weight.
500						2.5YR6/1	S	Reddish gray calcareous and carbonaceous siltstone. Local fine sedimentary rip-up textures. Few quartz microveinlets. Less clayey and more competent that interval above.
510						2.5YR6/2	S	Pale red siltstone; soft, friable, thinly laminated; drill cuttings are as lenticular chips.
520						2.5YR6/2	S	Pale red siltstone, as above, with some calcite fracture fillings.
530						2.5YR5/3	W	Reddish brown siltstone. Few small light reduction spots.
540						7.5YR6/1	W	Gray arkosic sandstone; fine-grained, well sorted grains, weakly laminated, some fine cross bedding. Siliceous cement with a small amount of calcite.

Project Name: **Bisbee Mitigation**								Boring No.**: BMO-2008-7M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
550	Morita Formation					7.5YR7/2	N	Pinkish gray sandstone; fine-grained, few reddish and black (possibly fine carbon) flecks, moderately hard, siliceous cement.
560						2.5YR4/3	S	Reddish brown mudstone; soft, laminated, small lenses of clay locally. Few gravel sized clasts of white fine-grained limestone.
565						2.5YR4/3	S	Reddish brown mudstone to siltstone; soft, laminated, as above with some very fine-grained sand; sand content greater than previous interval.
570						5YR3/2	S	Dark reddish brown mudstone; 1% white finely vuggy cryptocrystalline quartz chips.
580								
585						5YR5/1- 5YR4/1	N-W	Gray to dark gray arkosic sandstone; very fine-grained, silty, lacks laminations; siliceous cement, moderately hard, few white CaCO3 chips, probably occurring as calcite fracture fillings.
590						2.5YR5/1	N-W	Reddish gray fine-grained arkosic siltstone; uniformly colored, slightly laminated; trace white calcite fracture fillings.
600						2.5YR5/1	W	Reddish gray calcareous siltstone to very fine-grained sandstone. Rare greenish gray small reduction spots Formation fluctuates alternately between siltstone and very fine-grained sandstone.
610						2.5YR5/1	S	Reddish gray calcareous arkosic sandstone; very fine-grained, well-sorted, slightly laminated; uniformly colored, moderately hard. Few white loose calcite chips, and calcite fillings in fine fractures.
620						2.5YR5/1	S	Reddish gray silty limestone, calcareous siltstone, to silty calcareous very fine-grained arkosic sandstone; sand grains are well-sorted quartz with few opaques and feldspars; few white calcite and silica chips.
630						2.5YR5/1- 2.5YR4/1	W-M	Reddish gray to dark reddish gray siltstone and very fine-grained silty arkosic sandstone. Few amber colored calcite-filled vugs; also has tiny (<.25 mm) angular voids, many empty, others filled with calcite and other non-HCl-reactive clear mineral, possibly selenite.
640						7.5YR5/1 - 7.5YR7/1	M	Gray to light gray fine-grained arkosic silty sandstone, well sorted. Orange calcite and white silica fill few small <1mm vugs. Small <1mm black disseminated oxide (manganese?) spots.
650						2.5YR5/3	S	Reddish brown calcareous sandy siltstone, fine sandstone, with some clay interbeds. Sandstone is hard; claystone soft friable. Locally sandstone layers contain small siltstone lithic fragments. Few small <1mm reduction spots; trace black oxide spots.
660						5YR5/2	N-W	Reddish gray siltstone with very fine-grained silty sandstone layers; few white calcite fracture coatings.

Project Name: **Bisbee Mitigation**								Boring No.**: BMO-2008-7M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
670	Morita Formation					5YR5/3 -	M	Reddish brown to reddish gray interbedded hard siltstone, very fine-grained hard sandstone, and soft claystone. Slightly laminated.
						5YR5/2		
680						5YR5/3	M	Reddish brown moderately laminated interbedded calcareous siltstone, sandstone, and claystone. Sandstone is fine-grained, well-sorted, and hard; siltstone and claystone are moderately soft, easily broken into platy fragments.
690						5YR5/3	M	Reddish brown calcareous sandstone, siltstone and claystone, as above.
700						5YR4/2 -	S	Dark reddish gray, reddish gray, and pinkish gray very fine-grained silty arkosic sandstone
						5YR6/2		
710						5YR5/2	M	Reddish gray silty arkosic sandstone, as above.
720						5YR4/2	M-S	Dark reddish gray sandy siltstone; weakly laminated; sand grains are very fine-grained, well-sorted.
730						5YR4/2	M-S	Dark reddish gray fine sandy siltstone, weakly laminated; few < 1mm thick calcite fracture fillings.
740						5YR4/2	W-N	Dark reddish gray siltstone, locally with about 10% very fine-grained, well-sorted arkosic sandstone, moderately laminated, moderately soft.
750						5YR4/2	W	Dark reddish gray siltstone, locally sandy, as above.

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
10	Basin Fill	60	25	15	GM	5YR 6/4	S	Light reddish brown silty gravel with sand. Gravel is angular to subrounded, up to 2 cm in diameter, composed primarily of Pinal Schist (phyllite and metamorphic quartz) with lesser amounts of gray limestone and gray chert, and small amounts of white fine-grained quartzite and silicified limestone with fossil fragments. Sand is fine to coarse-grained, subrounded, composed of quartz and lithic grains. Strong caliche cement.
20		55	35	10	GP-GM	5YR 8/3	S	Pink gravel with silt and sand with caliche cement. Gravel clasts are ≤ 1 cm in diameter, comprised of subangular to subrounded caliche chunks, Pinal Schist, gray limestone, with minor greenish chert clasts. Sand is coarse to fine-grained with coarse grains most common; composed largely of quartz with some lithic grains. Fines are primarily calcareous clay.
30		35	40	25	SM	5 YR 6/4	S	Light reddish brown silty sand with gravel. Gravel clasts are angular to rounded, equidimensional to elongate up to 3 cm on long side, mostly Pinal Schist with little gray limestone and quartzite. Sand is mostly coarse and fine-grained with little medium-grained material, poorly graded, composed of quartz and lithic grains. Caliche cement.
40		60	30	10	GP-GM	5YR 6/3	S	Light reddish brown gravel with silt and sand. Gravel is mostly fine (≤ 1 cm in diameter), angular to rounded, primarily Pinal Schist with lesser amount of limestone and small amounts of chert and red siltstone. Sand is coarse to fine-grained, composed of quartz and lithic grains; strong caliche cement.
50		50	40	10	GP-GM	5YR 7/2	S	Pinkish gray gravel with silt and sand. As above; caliche cement.
60		65	20	15	GC	5YR 6/3	S	Light reddish brown clayey gravel with sand. Gravel is angular to subrounded, up to 4 cm in diameter, composed of gray limestone, Pinal Schist, sandstone, quartzite, and siltstone. Fewer Pinal Schist clasts than in previous intervals. Many clasts have either calcareous clay or caliche coatings. Sand is fine to coarse-grained, composed of quartz and lithic grains.
70		55	30	15	GC	5YR 7/2	S	Pinkish gray clayey gravel with sand. Gravel is angular to subrounded; mostly ≤ 1 cm in diameter; composed of clasts of limestone, yellowish to gray sandstone, red and green siltstone, Pinal Schist (phyllite and metamorphic quartz), reddish brown sandy siltstone, and arkose. Limestone and clastic sediment clasts are more abundant than Pinal Schist clasts. Very little caliche; some calcareous clay coatings. Sand is fine to coarse-grained, composed of quartz and lithic grains.

Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
80		55	30	15	GC	5YR 6/3	S	Light reddish brown clayey gravel with sand. Gravel is mostly angular and subangular with lesser subrounded clasts up to 2 cm in diameter; composed primarily of clastic sediments including reddish brown, tan and green fine-grained sandstone, red and green siltstone, with smaller amounts of phyllite, quartz and limestone. Sand is fine to coarse-grained, composed mostly of lithic grains with lesser quartz. Calcareous clay matrix coatings. Very little caliche.
90		50	35	15	GC	5YR 6/3	S	Light reddish brown clayey gravel with sand, as above. Gravel clasts are mostly clastic lithologies (various sandstones and siltstones) with lesser phyllite, quartz, limestone, and chert. Calcareous clay coatings and matrix material.
100		70	15	15	GC	5YR 6/3	S	Light reddish brown clayey gravel with sand. Gravel is angular to subrounded; finer pebbles more rounded; coarser clasts are angular to subangular. Clasts lithologies are primarily reddish brown, gray, green, and white sandstone, arkosic sandstone, and siltstone, with lesser chert, phyllite, quartz, limestone, and trace white volcanics. Gravel clasts are up to 3 cm in diameter; caliche-clay coatings are common. Few sandy clay balls.
110		45	40	15	GM	5YR 7/3	S	Pink clayey and silty gravel with sand. Gravel is mostly subangular to subrounded, ≤ 1 cm in diameter, grading to coarse sand. Clast lithologies are primarily clastic sediments as above with lesser phyllite, limestone, and quartz. Sand is coarse to fine-grained, well-graded through to silt, composed of quartz and lithic grains. Clayey, sandy caliche occurs as coatings on gravel clasts and as chunks in the sample.
120	Basin Fill	35	45	20	SM	5YR 7/2	S	Pinkish gray silty sand with gravel. Gravel is ≤1 cm in diameter, grading to coarse sand; angular to subrounded; composed primarily of reddish brown, gray, green, and white sandstone and siltstone, with lesser phyllite, quartz, and limestone. Clayey carbonate coatings on some clasts; some caliche chips in the sample. Sand is fine to coarse-grained, well-graded through to silt, composed of quartz and lithic grains.
130		30	45	25	SM	5YR 7/3	S	Pink silty sand with gravel. Gravel is angular to rounded; angular freshly broken pieces are up to 2 cm in diameter; rounded to subrounded pebbles are ≤ 1 cm in diameter. Composition of gravel is as above, however phyllite and limestone clasts have increased to about equal to the amount of clastic sedimentary clasts; few caliche chunks. Sand is as above.
140		55	30	15	GM	5 YR 6/3	S	Light reddish brown silty gravel with sand. Gravel clasts are angular to subrounded, some with mixed clay, fine sand, and carbonate coatings; composed primarily of clastic sediments including abundant greenish gray fine-grained sandstone, with lesser phyllite clasts and little limestone. Sand is as above.
150		40	30	30	GM	2.5YR 6/3	S	Light reddish brown silty gravel with sand. Gravel clasts are subangular to subrounded, composed of abundant material derived from the Pinal Schist, clastic sediments, and lesser amount of limestone; some calcite-silt-fine sand coatings are present. Sand is fine to coarse-grained, composed of lithic grains and quartz.
160		70	15	15	GM	2.5YR 6/4	S	Light reddish brown silty gravel with sand. Gravel clasts are mostly ≤ 1 cm in diameter with few 2 cm clasts; angular to subangular with few subrounded pebbles. Gravel is composed primarily of phyllite and metamorphic quartz, some sandstone and siltstone, and trace limestone. Few carbonate coatings on clasts. Sand as above.
170		70	15	15	GM	2.5YR 6/3	S	Light reddish brown silty gravel with sand, as above. The amount of Pinal Schist (phyllite and metamorphic quartz) clasts is approximately equal to the amount of clastic sedimentary clasts, with little gray limestone. Few calcite-fine sand cement coatings. Sand as above.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
173	Basin Fill	70	15	15	GM	5YR 6/2	S	Pinkish gray silty gravel with sand. Driller reports that the formation is becoming hard at this depth. Material is as above with more abundant calcite-fine sand coatings indicating a greater degree of cementation. Sand as above.
180		40	35	25	GM	2.5YR 7/2	S	Pale red silty gravel with sand. Gravel clasts are ≤ 1 cm diameter, grading to coarse sand; angular to subrounded; composed primarily of gray, reddish brown, and green fine-grained sandstones and siltstones, with lesser phyllite, quartz and trace limestone. Sand is coarse to fine-grained, composed mostly of lithic grains. Few calcite-fine sand cement coatings.
190		20	60	20	SM	2.5YR 6/3	S	Light reddish brown silty sand with gravel. Gravel clasts are mostly subangular to subrounded, with few angular and rounded clasts. Clasts are ≤1 cm diameter, grading to coarse sand, composed primarily of variably colored sandstones and siltstones, with lesser phyllite. Few calcite-fine sand cement coatings. Sand is fine to coarse-grained, composed primarily of lithic grains, particularly in the coarser fraction.
200		85	10	5	GP	2.5YR 6/3 - 2.5YR 7/2	M	Light reddish brown to pale red gravel. Gravel clasts are mostly subangular to rounded, up to 2 cm but mostly ≤1 cm in diameter, composed primarily of reddish brown, gray, and greenish sandstone, siltstone, and arkosic sandstone, with lesser phyllite and small amount of gray silty limestone. Calcite-sand cement surface coatings are common. Few chunks of cemented silty sand are present in the sample.
210		60	25	15	GM	2.5 YR 6/3	S	Light reddish brown silty gravel with sand. Gravel clasts are ≤ 1 cm in diameter, mostly subangular to subrounded with a few rounded pebbles. Calcite-sand cement coatings are common. Clast lithologies are as above. Sand is coarse to fine-grained, subangular to subrounded, mostly fine-grained and coarse-grained with little medium-grained, poorly graded.
220		35	45	20	SM	2.5YR 6/3	S	Light reddish brown silty sand with gravel. Gravel is fine (≤ 1 cm diameter) with some calcite-sand coatings; clasts are angular to subrounded, with lithic compositions as above. Sand is coarse to fine-grained, well-graded through to silt, angular to subrounded; coarse sand particles are mostly lithic grains; fine sand is mostly quartz with few lithic grains.
230		35	45	20	SM	2.5YR 6/3	S	Light reddish brown, silty sand with gravel, as above. Abundant 0.5 - 1.0 cm diameter subrounded pebbles in the gravel fraction.
240		30	55	15	SM	5YR 6/3	S	Light reddish brown silty sand with gravel. Gravel clasts are angular to subrounded, mostly subangular; ≤ 1 cm in diameter; primarily reddish brown sandstone, with lesser amount of gray, green and white sandstone, smaller amount of phyllite, and trace limestone. Some calcite-sand coatings. Sand is mostly medium-grained with some fine and coarse grains; composed mostly of quartz with few lithic grains; loose, dry.
250		25	65	10	SW-SM	5 YR 5/3	S	Reddish brown sand with silt and gravel. Gravel clasts are angular to subrounded, ≤1 cm in diameter; mostly reddish brown sandstone, siltstone, and arkose, with lesser phyllite and little green siltstone. Sand is coarse to fine-grained, well-graded, loose. Coarse sand is composed of lithic grains; finer sand is mostly quartz. Calcite-sand coatings on some gravel clasts.
260		20	70	10	SW-SM	5YR 5/3	S	Reddish brown sand with silt and gravel. As above, with slightly less gravel; gravel clasts are ≤ 1 cm in diameter, grading to coarse sand. Sand as above, loose, causing difficulty lifting cuttings.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
270	Basin Fill	15	65	20	SM	5YR 6/3	S	Light reddish brown silty sand with gravel; some clay in finer fraction as well. Gravel clasts are angular to subangular, mostly ≤ 1 cm in diameter, dominantly phyllite and quartz derived from Pinal Schist, with approximately 10% fine-grained sandstone and siltstone clasts; calcite-sand cement on some surfaces. Sand is well-graded, composed of fine to coarse-grained quartz and lithic grains.
280		75	10	15	GC	5YR 7/3	S	Pink clayey gravel. Gravel clasts are mostly ≤1 cm in diameter grading to coarse sand, composed dominantly of angular to subangular phyllite with lesser amount reddish brown fine-grained sandstone, with calcite-fine sand cement coatings. Sand is mostly coarse and fine-grained; poorly graded.
290		60	20	20	GC	5YR 7/3	S	Pink clayey gravel with sand. As above, with increased sand and fines. Partial calcite-fine sand cement coatings on most gravel clasts.
300		tr	70	30	SC	5YR 7/4	S	Pink clayey sand. Sand is coarse to fine-grained, but mostly coarse and medium-grained, moderately well-graded, grains are subangular to subrounded, composed of phyllite and quartz.
310		20	60	20	SC	5YR 6/3	S	Light reddish brown clayey sand with gravel. Some silt also present in the fines fraction. Gravel clasts are angular to subangular, ≤1 cm in diameter, composed primarily of phyllite; few calcite cement coatings. Sand is mostly phyllite lithic grains and quartz.
320		15	65	20	SC	5YR 6/4	S	Light reddish brown clayey sand with gravel. As above, mostly phyllite with little sandstone and siltstone in gravel fraction. Sand fraction is also mostly phyllite with fewer sandstone and siltstone lithic grains and quartz.
330		65	20	15	GM-GC	2.5YR 6/3	S	Light reddish brown clayey-silty gravel with sand. Gravel is composed of about 90% phyllite and quartz clasts derived from Pinal Schist; with 10% fine-grained sandstone and siltstone; clasts are angular to subrounded; many phyllite clasts are tabular. Few calcite coatings. Sand is fine to coarse-grained. Some clay is present as well as silt in the fines fraction.
340		65	20	15	GC	2.5YR 6/3	M	Light reddish brown clayey gravel with sand. Gravel is composed primarily of phyllite with little sandstone and siltstone clasts; clasts are angular to subrounded, ≤1.5 cm in diameter, grading to coarse sand. Few calcite-fine sand coatings.
350		5	90	5	SW	5YR 5/3	W	Reddish brown sand. Sand is coarse to very fine-grained, well-graded, loose; grains are subangular to subrounded, composed of quartz and phyllite lithic grains. Gravel as above with few calcite coatings; one 3 cm diameter quartzite clast. FIRST WATER @ 357ft bls
360		10	85	5	SW	5YR 5/3	W	Reddish brown sand, as above. Gravel fraction is composed of ≤ 1 cm diameter angular to subangular phyllite clasts with calcite-sand cement coatings.
370		35	60	5	SW	5YR 5/3	M	Reddish brown sand with gravel. Sand as above. Gravel is composed of mostly subangular, tabular ≤1 cm phyllite clasts with calcite-sand cement coatings.
380		60	35	5	GP	2.5YR 5/3	M	Reddish brown gravel with sand. Gravel is composed of angular to subrounded, often tabular ≤3 cm clasts; clast lithologies are mostly phyllite with little sandstone and siltstone with calcite-sand cement coatings. Sand as above.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
390	Basin Fill	70	25	5	GP	5YR 6/3	M	Light reddish brown gravel with sand. Gravel clasts are ≤ 2 cm in diameter, grading to coarse sand; composed of phyllite and quartz derived from Pinal Schist, have calcite-sand cement coatings, and are equidimensional to tabular in shape. Sand as above.
400		70	25	5	GP	5YR 6/3	M	Light reddish brown gravel with sand, as above but with increased quartzite and fine-grained arkosic sandstone (possibly derived from Morita Formation) clasts; Pinal Schist continues to be the dominant clast lithology.
410		15	80	5	SW	5YR 6/3	W	Light reddish brown sand with gravel. Gravel is composed of clasts ≤1 cm in diameter, grading to coarse-grained sand; angular to subrounded, mostly phyllite with little sandstone and siltstone. Sand is coarse to fine-grained, well-graded, subangular to subrounded quartz and phyllite lithic grains.
420		5	90	5	SW	5YR 6/3	W	Light reddish brown sand. Sand is moderately well-graded, coarse to fine-grained, but mostly medium to fine-grained. Grains are subangular to subrounded quartz and phyllite lithic grains. Gravel is made up of ≤1 cm diameter phyllite clasts, few with calcite-sand cement coatings. HCl reaction is confined to cement.
430		5	90	5	SW	5YR 6/3 - 5YR 5/2	M	Light reddish brown to reddish gray sand. As above but sand is well-graded with more coarse sand. Gravel as above. Finer sand is light reddish brown; coarser is reddish gray.
440		15	80	5	SW	5YR 6/3	M	Light reddish brown sand with gravel. Sand is as above, with larger gravel fraction. Gravel clasts are up to 2 cm, angular to subrounded, composed mostly of phyllite with little fine-grained sandstone; calcite-sand cement coatings on some clasts.
450		25	70	5	SW	5YR 6/3-5/2	M	Light reddish brown to reddish gray sand with gravel, as above with larger gravel fraction.
460		25	70	5	SW	5YR 6/3	M	Light reddish brown sand with gravel, as above.
470		20	75	5	SW	5YR 6/3	M	Light reddish brown sand with gravel, as above; slight increase in the relative amount of sandstone and siltstone clasts, but Pinal Schist phyllite remains the dominate clast lithology.
480		25	70	5	SW	5YR 6/3	M	Light reddish brown sand with gravel. Gravel is composed of approximately 60% phyllite and 40% clastic sedimentary rocks (sandstone, siltstone, arkosic sandstone). Sand fraction is fine to coarse-grained with abundant lithic grains. Gravel and sand clasts are angular to subrounded; few calcite-fine sand cement coatings.
490		tr	90	10	SW	2.5YR 6/2	M	Pale red sand. Sand is coarse to fine-grained; fine sand is composed of quartz grains; medium sand is comprised of quartz sandstone and little phyllite lithic grains; coarse sand is mostly sandstone with little phyllite lithic grains.
495	**Morita Formation**				bedrock	2.5YR 8/1	W	White fine-grained quartz sandstone. Sandstone is composed of clear quartz grains with few gray opaques with white calcite cement. Few chips of reddish brown siltstone and fine-grained sandstone are present in the sample as well. Morita Formation.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
500	Morita Formation					5YR 8/2, 7/1 to 6/1	W	Pinkish white, light gray, to gray fine-grained quartz sandstone; white calcite cement. Morita Formation.
510						2.5YR 5/3	W	Reddish brown fine-grained sandstone and siltstone. Some white sandstone and phyllite in sample, probably washing down from the basin fill. Phyllite is probably fall down from basin fill above. Some difficulty in picking up the cuttings with the reverse circulation method of drilling at this depth.
520						2.5YR5/1 to 5/3	W	Reddish gray, weak red, to reddish brown siltstone and fine-grained sandstone. Sample has some phyllite and quartz contaminants from basin fill above Morita Formation contact.
525						2.5YR 6/2	W	Pale red quartz sandstone. Less basin fill contamination of sample than at 520'.
530						2.5YR 5/2, 2.5YR 6/2	M	Weak red siltstone, clay balls, and pale red fine-grained sandstone. Few reduction bleached spots in siltstone; little crystalline calcite in hairline fractures.
540						2.5YR 4/2	W	Weak red siltstone with ~10% white (2.5YR 8/1) sandstone.
550						2.5YR 4/2	W	Weak red siltstone with few scattered white bleached reduction spots. Few gray limestone chips.
560						2.5YR 4/2	W	Weak red siltstone with few white reduction spots.
570						2.5YR 4/3	M	Reddish brown silty sandstone, fine-grained, moderately well-sorted quartz sandstone with carbonate cement. Moderate reaction to HCl.
580						2.5YR 4/3	M	Reddish brown silty sandstone, as above; the sample also contains a trace amount of limestone chips up to 1/4" in diameter.
590						2.5YR 4/3	M	Reddish brown fine-grained, silty quartz sandstone, with few 1 mm calcite nodules.
600						2.5YR 4/3	M	Reddish brown silty, fine-grained quartz sandstone. One slickenside surface noted.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
610	Morita Formation					2.5YR 5/3	M	Reddish brown crushed claystone and sandstone. Claystone is approximately 70% of the sample, with soft, moderately plastic, sticky, cohesive clay. Sandstone is fine-grained, fairly hard, with calcareous cement. Moderate reaction to HCl.
620						2.5YR 4/3	M	Reddish brown silty sandstone, limestone, and clay. Sandstone is as described above. Clay and limestone each comprise approximately 10% of the sample.
630						2.5YR 5/4	M	Reddish brown silty sandstone, very fine-grained, with carbonate cement. As above except that chips are slightly platy, fairly hard. Moderate reaction to HCl.
640						2.5YR 4/3	M	Reddish brown sandstone, mix of medium to fine grained sandstone, calcareous cement, hard; few pieces of quartzite. Moderate reaction to HCl.
650						2.5YR 6/2	M	Pale red arkosic sandstone and clay. Sandstone is medium to fine-grained, well-indurated, composed of quartz with 10% feldspar, few opaques and few reddish brown siltstone lithic grains with calcareous cement. Sample also contains approximately 10% soft clay that is moderately plastic, sticky, cohesive. Moderate reaction to HCl.
660						2.5YR 5/2	W-M	Weak red feldspathic sandstone. Sandstone is medium to fine-grained, carbonate cemented, hard; coloration of individual chips vary from dark through light grays of various hues. Weak to moderate reaction to HCl.
670						2.5YR 4/2	W	Weak red siltstone and fine-grained sandy siltstone. Siltstone is hard, very slightly laminated, calcareous. Few 1mm white calcite veinlets. Weak reaction to HCl.
680						2.5YR 4/3	M	Reddish brown clayey siltstone, sandstone with some clay. Siltstone is fairly hard, weakly laminated, with carbonate cement. Sandstone is fine to very fine-grained, hard, with carbonate cement. Small amount of clay (≤ 5%), is soft, sticky. Moderate reaction to HCl.
690						2.5YR 4/3	M	Reddish brown sandstone, medium to fine-grained, hard, carbonate cement; few small bleached spots. Some white quartzite and quartz grains, small amount of clay (≤ 2%). Moderate reaction to HCl.
700						2.5YR 4/3	M	Reddish brown sandy siltstone. Sand grains are fine to very fine- grained, well-indurated, with carbonate cement; slightly platy. Moderate reaction to HCl.
710						2.5YR 4/4	M	Reddish brown claystone, silty claystone, and fine-grained silty sandstone, and clay. Claystone fraction is moderately soft, slightly laminated, with calcareous cement. Silty sandstone is fine to very fine-grained, moderately hard, with calcareous cement. Clay is very soft, sticky, moderately plastic. Moderate reaction with HCl.
720						2.5YR 7/2, 2.5YR 8/2	M	Pale red to pinkish white sandstone, medium-grained, composed primarily of quartz sand with a few % feldspar; carbonate cement, moderately hard, clean (no silt). Moderate reaction to HCl.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-8M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
730	Morita Formation					2.5YR 7/2	M	Pale red sandstone, as above except that drilling action has disintegrated much of the sandstone to a beach sand consistency, indicating less induration; weak laminations. Trace disseminated limonite after fine pyrite. Moderate reaction to HCl.
738						2.5YR 4/3	M	Reddish brown silty sandstone, claystone, clay mix. Claystone is fairly soft, easily broken, calcareous, weakly laminated, platy. Clay fraction is soft plastic, sticky, moderate reaction to HCl.
740						2.5YR 4/3	M	Reddish brown calcareous mudstone. Material is fairly soft, easily broken, weakly laminated, platy. Moderate reaction to HCl.
744						2.5YR 4/3	M	Reddish brown sandstone, fine to very fine-grained, carbonate cement, moderately hard, slightly platy, Moderate reaction to HCl.
750						2.5YR 4/3	M	Reddish brown silty, slightly clayey sandstone, fine to very fine-grained; carbonate cement, moderately hard, slightly platy. Moderate reaction to HCl.
760						2.5YR 5/2	M	Weak red silty sandstone. Fine-grained, carbonate cement, hard; few hairline calcite veinlets. Moderate reaction to HCl.
770						2.5YR 5/2, 10R 5/2	M	Weak red sandstone and silty sandstone. Sandstone is fine-grained, with carbonate cement, hard. Moderate reaction to HCl.
780						2.5YR 5/3	M	Reddish brown calcareous siltstone, moderately soft, platy, weakly laminated, some fine-grained sand. Moderate reaction to HCl.
790						2.5YR 5/3	M	Reddish brown sandy siltstone. Sand is fine-grained, carbonate cement, fairly hard; moderate reaction to HCl.
800						2.5YR 6/1	M	Reddish gray sandstone. Composed of medium to fine-grained primarily quartz grains with a few % feldspar grains, <1% very fine-grained black opaques, and limonite after pyrite; carbonate cement; hard. Moderate reaction to HCl.
810						2.5YR 4/3	S	Reddish brown sandy siltstone. Sand where present in the siltstone is fine-grained. Siltstone is moderately hard, with calcareous cement. Strong reaction to HCl.
820						2.5YR 5/4	W-M	Reddish brown mix of clay, claystone, and siltstone. Clay fraction is about 30%, very soft, moderately plastic, cohesive, sticky. Claystone is moderately soft, platy, very weakly laminated. Moderate reaction to HCl.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
830	Morita Formation					2.5YR 5/1	W-M	Reddish gray siltstone with a small amount of limestone.
840						2.5YR 4/3	M	Reddish brown siltstone with small amount of very fine-grained sandstone, fairly hard, carbonate cement, some white calcite in fractures. Moderate reaction to HCl.
850						2.5YR 4/3 7.5YR 6/1	WM	Reddish brown sandy siltstone and sandstone, fairly hard, carbonate cemented. Sandstone is fine-grained, primarily a quartz sandstone with carbonate cement, hard. Contact between siltstone and sandstone is visible in larger chips. Overall moderate reaction to HCl.
860						2.5YR 4/2	WM	Weak red silty clay and claystone. Clay is soft, slightly plastic, cohesive, sticky. Moderate reaction to HCl.
870						2.5YR 4/3	S	Reddish brown claystone, soft, slightly platy, carbonate cement, strong reaction to HCl.
880						2.5YR 7/1	M	Light reddish gray sandstone; fine to medium-grained; primarily quartz with 10% feldspar and ≤1% speckling of black grains, carbonate cement, fairly hard, moderate reaction to HCl.
890						2.5YR 7/1 2.5YR 4/3	M M	Light reddish gray sandstone and siltstone mix. Sandstone is as described above; siltstone is reddish brown, platy, slightly laminated, fairly soft, with carbonate cement. Reacts moderately with HCl.
900						2.5YR 7/1 2.5YR 4/3	W-M	80% light reddish gray fine-grained arkosic sandstone with 20% reddish brown siltstone, as above.
910						2.5YR 4/3	M	Reddish brown sandy siltstone. Sand is very fine-grained, carbonate cement, slightly platy, fairly hard. Moderate reaction to HCl.
920						2.5YR 7/1 2.5 YR 5/3	M	Light reddish gray arkosic fine-grained sandstone with 25% reddish brown silty sandstone. Sand grains are primarily quartz with some rust colored staining on surfaces. Carbonate cement, fairly hard, moderate reaction to HCl.
930						2.5YR 7/1	M	Light reddish gray arkosic sandstone. Sand grains are primarily quartz with some rust colored staining on surfaces, carbonate cement, hard. Moderate reaction to HCl.
940						2.5YR 5/2	S	Weak red silty sandstone, sand is fine to very fine-grained, fairly hard, carbonate cemented, strong reaction to HCl.

Project Name:		Bisbee Mitigation Order						Boring No.: **BMO-2008-8M**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
950	Morita Formation					2.5YR 5/2	M	Weak red arkosic sandstone, medium to very fine-grained, hard, carbonate cement. Moderate reaction to HCl. Few calcite fracture fillings.
960						2.5YR 7/1	M	Light reddish gray arkosic sandstone. Sandstone is medium grained, composed primarily of quartz with a few % feldspar, few reddish brown siltstone lithic grains, and few black opaque grains. Some grains exhibit rust colored staining. Few chips have calcite fracture coatings, moderate reaction to HCl.
970						2.5YR 7/1	M	As above
980						2.5YR 7/1	M	As above, very consistent, identical in appearance.
990						2.5YR 4/3	M	Reddish brown clay and claystone with some sandy siltstone. Clay fraction is about 30%, very soft, moderately plastic, sticky, cohesive. Claystone is soft, very slightly laminated, platy. Silty sandstone is very fine-grained, fairly hard, with carbonate cement. Reaction to HCl is moderate.
1000						2.5YR 4/3	M	Reddish brown clay and claystone, as described above, except that clay fraction has increased to about 40% of total sample.
1010						25 YR 7/2	M	Pale red sandstone. Medium to fine-grained quartz with a few % feldspar; carbonate cement, hard. Moderate reaction to HCl
1020						2.5 YR 6/2	M	Pale red sandstone, as above with about 30% reddish brown siltstone.
						2.5YR 4/3	M	Fairly soft, slightly platy, carbonate cement. Moderate reaction to HCl.
1030						2.5YR 6/3	M	Light reddish brown arkosic sandstone, medium to fine-grained, primarily quartz with 10% feldspar and up to 1% opaque grains, carbonate cement, fairly hard, moderate reaction to HCl.
1040						2.5YR 6/3	M	Light reddish brown, arkosic sandstone, as above.
1050						2.5YR 6/3	M	As above; with fine white calcite veinlets and limonite stain on few fractures.
1060						2.5YR 4/3	M	Reddish brown clay and claystone. Clay fraction is about 40% of sample. Soft, moderately plastic, cohesive, sticky; claystone is fairly soft, platy, very slightly laminated; reaction to HCl is moderate.

Project Name:		Bisbee Mitigation Order						Boring No.: BMO-2008-8M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
1070	Morita Formation					2.5YR 4/3	M	Reddish brown clay and claystone with small amount of limestone and trace sandstone. Claystone is fairly soft, platy, very slightly laminated, calcareous. Clay fraction comprises about 30% of sample; is soft, plastic, sticky, cohesive. Sandstone is medium to fine-grained, composed primarily of quartz with carbonate cement. Moderate reaction to HCl.
1080						2.5YR 4/3	M	Reddish brown claystone and siltstone with clay. Claystone and clay fractions are as described above except that clay comprises about 20% of the sample. Siltstone is moderately soft, slightly platy, contains some very fine-grained sand. Reacts moderately to HCl.
1090						2.5YR 4/3	M	Reddish brown siltstone and claystone, as above.
1100						2.5YR 6/3	M	Light reddish brown feldspathic sandstone. Sandstone is fine-grained, with calcareous cement, hard, composed primarily of quartz with approximately 10% feldspar and <1% black opaques. Moderate reaction to HCl.
1110						2.5YR 6/3	M	Light reddish brown feldspathic sandstone, as above.
1120						2.5YR 6/3	M	Light reddish brown feldspathic sandstone, as above.
1130						2.5YR 4/4	S	Reddish brown clay and claystone. Clay makes up about 40-50% of total sample, is soft, moderately plastic, cohesive. Claystone is slightly platy, moderately soft. Strong reaction to HCl.
1140						2.5YR 4/4	S	Reddish brown mudstone. Similar to above except that non-indurated clay content is only about 5% of sample. Mudstone is moderately well indurated, calcareous, composed of clay, silt and small amount of fine-grained sand. Strong reaction to HCl.
1150						2.5YR 6/3	M	Light reddish brown fine-grained arkose; composed of quartz, feldspar, and mudstone lithic grains in calcareous cement; hard. Moderate reaction to HCl.
1160						2.5YR 6/3	M	Light reddish brown fine-grained arkose, as above. Moderate reaction to HCl.
1170						2.5YR 6/3	M	Light reddish brown arkose and silty claystone. Arkose is as described above; silty claystone is approximately ≤ 10% of sample; and is platy, soft, calcareous. Moderate reaction to HCl.
1180						2.5YR 4/3	M	Reddish brown claystone, silty claystone and clay. Claystone is soft platy, very slightly laminated. Calcareous silty claystone is fairly hard but can be broken by hand, calcareous cement. Clay fraction make up about 5-10% of total sample, is very soft, moderately plastic, cohesive, sticky, calcareous. Different lithologies in the sample may occur as thin interbeds. Reaction to HCl is moderate.

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
1	Basin Fill	15	25	60	ML	2.5YR 5/6	N	Red sandy silt with gravel. Gravel clasts are up to 3" in diameter; subangular to well rounded, assortment of volcanics, light colored silicified limestone, chert; manganese oxide stain on surfaces of some clasts. Sand fraction is fine to very fine-grained, loose powdery, dry. No reaction to HCL.
10		40	40	20	SM	2.5YR 6/4	S	Light reddish brown silty sand with gravel. Gravel clasts up to 1/2"diameter, angular to rounded; primarily gray through white limestones, quartz, red fine-grained sandstone, few volcanics, some fragments of caliche. Sand fraction is coarse through very fine-grained, fairly well-graded through to silt fraction, loose dry mix, very strong reaction to HCL.
20		25	45	30	SM	2.5YR 6/4	M	Reddish brown silty sand with gravel. Gravel clasts up to 2" max diameter, angular to rounded, primarily pieces of a dark gray schist, dark through light gray limestones, quartz, chert, reddish fine-grained sandstone. Sand fraction is primarily medium through very fine-grained, loose dry mix; moderate reaction to HCL.
30		20	20	60	ML	2.5YR 5/4	S	Reddish brown sandy silt with gravel. Gravel and sand fractions as above; silt fraction has increased considerably, dry flour like texture, very strong reaction to HCL.
40		60	20	20	GM	2.5YR 6/4	S	Light reddish brown silty gravel. Gravel clasts up to 2" maximum diameter, subangular to rounded, clasts are coated with calcium carbonate, composed primarily of schists with some quartz, limestone, chert with strong caliche cement. Sand fraction is coarse though very fine-grained; loose mix, dry, strong reaction to HCL.
50		20	15	65	ML	2.5YR 6/3	S	Light reddish brown gravelly silt with sand caliche. Gravel and sand fractions as described above. Cemented together as a caliche, dry very strong reaction to HCL.
60		35	15	50	ML	2.5YR 6/3	S	Light reddish brown gravelly silt with sand. As above, except for increase in gravel fraction.
70		55	15	30	GM	2.5YR 6/3	S	Light reddish brown clayey silty gravel with sand, gravel clasts up to 2" max. diameter, subangular to rounded, mix of gray schists, limestone, quartz, and red fine-grained sandstone, medium-grained sandstone, quartz. Considerable amount of carbonate coatings on clasts. Sand fraction is coarse through fine-grained; fines are as clayey silt, that are very sticky and moderately plastic when wet; strong reaction to HCL.

Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
80	Basin Fill	55	20	25	GM	2.5YR 6/3	S	Light reddish brown clayey, silty gravel with sand. As above except that fines fraction has decreased slightly.
90		60	25	15	GM	2.5YR 6/3	S	Light reddish brown silty gravel with sand. Gravel clasts are fine, up to 1/2 inch max. diameter. Subangular to fairly well rounded, composed primarily of schist, quartz, some limestone, fine-grained sandstone; loose mix, dry, very strong reaction to HCL.
100		15	35	50	ML	2.5YR 5/3	S	Reddish brown silt with gravel and sand. Gravel as described above. Sand fraction is primarily fine to very fine-grained; fines are as a calcareous silt. Dry powdery fine texture; very strong reaction to HCl.
110		70	15	15	GM	2.5YR 5/3	S	Reddish brown silty gravel. Gravel clasts to 2" max. diameter, sub-angular to rounded, composed of primarily fine-grained, calcareous cemented sandstone, reddish brown, light pale green limestone, and few schists. Sand fraction is coarse through very fine-grained; fines are as a calcareous silt; very strong reaction to HCl.
120		15	10	75	ML	2.5YR 4/3	S	Reddish brown silt with sand and gravel. Gravel fraction contains numerous reddish brown very fine-grained sandstones up to 1" diameter. Sand fraction is minor, fine-to very fine-grained; fines are a very soft silt. May contain small percentage of clay. Dry, very strong reaction to HCl.
130	Morita Formation				Bedrock	2.5YR 5/2		Reddish brown, very fine-grained silty sandstone and siltstone; dry, strong reaction to HCl. Bedrock; Morita Formation.
140						2.5YR 5/3	S	Reddish brown, slightly laminated, moderately indurated claystone. Slightly damp, very strong reaction to HCl. Morita Formation.
150						2.5YR 5/3	S	Reddish brown, very fine-grained silty arkosic sandstone with highly indurated siltstone, calcareous cement. Dry, very strong reaction to HCl. Morita Formation.
160						2.5YR 5/3	S	Reddish brown clayey and silty fine-grained sandstone and hard calcareous siltstone. Hairline calcite veinlets; dry. Very strong reaction to HCl. Morita Formation.
170						2.5YR 5/3	S	Reddish brown calcareous mudstone. Locally soft and poorly indurated. Dry, very strong reaction to HCl. Morita Formation.
180						2.5YR 5/3	S	Reddish brown, very fine-grained sandstone, siltstone and mudstone, all fairly hard, calcareous. Dry, very strong reaction to HCl. Morita Formation.
190						2.5YR 5/3	S	Reddish brown very fine-grained sandstone and mudstone. As above.

310	Morita Formation					2.5YR 4/3	S	Reddish brown siltstone, fairly well indurated, very weakly laminated, calcareous cement, with 1% gray limestone. Moderate to strong reaction to HCl. Morita Formation.
320							S	Reddish brown siltstone, fairly well indurated, very weakly laminated, calcareous cement, strong reaction to HCl. Morita Formation.
330						2.5YR 5/2	S	Weak red mudstone, weakly laminated, platy, moderately indurated, , strong reaction to HCl. Morita Formation.
340						2.5YR 4/2 7.5YR 6/1	S	Weak red sandstone. Very fine-grained, calcareous cement; some gray fine-grained sandstone also present. Strong reaction to HCl. Morita Formation.
350						2.5YR 4/2	M	Weak red mudstone and claystone. Platy, very slightly laminated, fairly soft, can be broken by hand, weak to moderate reaction to HCl. Morita Formation.
360						2.5YR 4/2	W	Weak red sandstone, very fine-grained, siliceous cement. Fairly hard, slightly platy; few white reduction spots. Very weak reaction to HCl. Morita Formation
370						2.5YR 6/1	W	Reddish gray sandstone, fine-grained quartz sandstone, siliceous cement, 1% high luster dark gray opaque grains, <1% limonite and hematite flecks; hard, homogenous, very weak reaction to HCl. Morita Formation.
380						2.5YR 4/2	M	Weak red siltstone, weakly laminated, platy. Fairly well indurated, moderate reaction to HCl. Morita Formation.
390						10R 4/2	W	Weak red fine-grained sandy mudstone. Morita Formation.
400						2.5YR 4/2	M	Weak red feldspathic silty sandstone, fine-grained, calcareous cement, platy chips, moderately soft, can easily be broken with fingers. Grains are quartz with 10% feldspar, 1% metallic gray opaques. Moderate reaction to HCl. Morita Formation.
410						2.5YR 7/2	M	Pale red sandstone, fine-to medium grained, primarily quartz, calcareous cement; hard, drilling as large 1" chips, some rust colored staining on surface of some chips, moderate reaction to HCl. Morita Formation.
420								Pale red sandstone, as above, with 1 % disseminated limonite and , 1% disseminated metallic opaques.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-9M**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
430	Morita Formation					2.5YR 7/2	M	Pale red medium-grained feldspathic sandstone with 1% disseminated limonite.
440						2.5YR 5/2 and 7.5YR 4/3	S	Weak red calcareous cemented mudstone and silty sandstone and 20% light reddish gray quartz sandstone, calcareous cement, fine-grained, fairly hard, very strong reaction to HCl. Few light gray reduction spots. Morita Formation.
450						2.5YR 4/2	W	Weak red mudstone, platy. Weakly laminated, moderately indurated, easily scratched but difficult to break in hand, weak reaction to HCl. Morita Formation.
460						2.5YR 4/2	W	Weak red mudstone, as above, with small amount (10%) of light reddish gray fine-grained quartz sandstone. Morita Formation.
470						2.5YR 4/2	M	Weak red sandstone, fine-grained, locally clayey and silty, calcareous cement, few calcite fracture fillings; no laminations observed, moderately hard, moderate reaction to HCl. Morita Formation.
480						2.5YR 6/2	M	Pale red sandstone, fine-grained. Primarily quartz, calcareous cement hard some rust stain, and few gray opaque grains. Small amount of reddish brown siltstone (<10%); moderate reaction to HCl.
490						2.5YR 6/2		Pale red sandstone, as above. 1% very fine disseminated limonite and < 1% dark fine-grained opaques.
500						2.5YR 5/2	M	Weak red siltstone, calcareous; fairly well indurated, small amount of gray limestone (<5%) saturated, moderate reaction to HCl.
510						2.5YR 5/2	M	Weak red silty sandstone, very fine-grained, calcareous cement, moderately hard, calcite filled fractures; some very light greenish gray sandstone (10%), saturated, strong reaction to HCl.
520						2.5YR 4/2	M	Weak red very fine-grained silty sandstone, as above. Few calcite veinlets.
530						2.5YR 4/2	M	Weak red calcareous mudstone.
540						2.5YR 4/2	S	Weak red fine-grained sandy arkosic mudstone. Trace amount of light brown clay that is soft, cohesive, sticky, and slightly plastic. Strong reaction to HCl.

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
10	Basin Fill	15	60	25	SM	5 YR 5/6	S	Yellowish red silty sand with gravel, cemented with caliche. Sand is mostly fine to very fine-grained with few medium and coarse grains; is mostly subrounded; composed primarily of quartz, ground caliche and lesser amount of lithic grains. Gravel clasts are subangular limestone and quartzite pebbles; sample contains gravel-sized angular chunks of caliche generated by drilling.
20		35	40	25	SM	5 YR 4/6	S	Yellowish red silty sand with gravel, cemented with caliche. Gravel clasts are mostly Pinal Schist phyllite with a little gray limestone. Sand is coarse to fine-grained composed of lithic grains, quartz, and ground up (by drilling) silty caliche. Gravel clasts are mostly angular to subangular pebbles < 1 cm in diameter.
30		30	50	20	SM	5 YR 6/3	S	Light reddish brown silty sand with gravel, strongly cemented with caliche. Finer sand and silt sized particles are mostly ground up caliche generated during drilling. Gravel-sized material includes limestone, chert, phyllite, quartzite, jasperoid, red siltstone pebbles, and caliche chunks. Sand is fine to coarse-grained subangular to subrounded quartz and lithic grains.
40		65	30	5	GP	5 YR 7/3	S	Pink gravel with sand. Polymictic gravel is composed of angular to subrounded limestone, sandstones, chert, quartz, and red siltstone pebbles up to 2 cm in diameter; few angular chunks of caliche broken up during drilling, and little quartz. Fines are caliche and clay.
50		5	20	75	CL	2.5YR 6/3	S	Light reddish brown calcareous clay with sand. Some silt and trace gravel also present. Gravel lithology as above. Sand is made up of fine-grained lithic grains and quartz. Sticky, cohesive, sandy, clayey caliche.
60		5	15	80	CL	2.5YR 5/4	S	Reddish brown clay with caliche. Sticky, cohesive, calcareous clay. Sand particles are mostly fine-grained with few medium to coarse lithic grains and quartz. Clay swells with water. Few gravel clasts include red siltstone, reddish brown sandstone; very fine-grained quartz sandstone; gray limestone, black and white silicified limestone, green arkosic sandstone, and few hard caliche chips generated by drilling.
70		5	15	80	CL	2.5YR 6/4	S	Light reddish brown clay with caliche. As above, with few more hard caliche chips. Gravel as above, mostly as fine pebbles.

Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
80	Basin Fill	30	45	25	SM	2.5YR 7/3	S	Light reddish brown silty sand with gravel. Little clay in fine fraction. Gravel is fine, grading to coarse sand, composed of phyllite and metamorphic quartz derived from Pinal Schist, reddish brown, tan, white and green fine-grained sandstone, and a little light gray limestone. Sand is mostly lithic grains of same composition. Fines are calcareous silt with little clay.
90		15	10	75	ML	2.5YR 6/4	S	Light reddish brown silt with gravel. Calcareous silt with a little clay. Sand is fine to coarse lithic grains. Gravel is polymictic composed of lithologies listed above.
100		20	20	60	ML	2.5YR 5/4	S	Reddish brown sandy silt with gravel. Gravel and sand are mostly phyllite derived from Pinal Schist with few caliche chunks. Clasts are broken angular to subrounded, up to 2 cm diameter. Interpreted to be weathered top of Glance Conglomerate.
110	Glance Conglomerate				bedrock	2.5YR 6/4	W	Reddish brown conglomerate. Phyllite and quartz clasts derived from the Pinal Schist; angular to subrounded pebbles in silty sand, moderately well-indurated matrix. Glance Conglomerate.
120						2.5YR 4/4	N	Reddish brown claystone with shaley partings; locally small < 1 mm white spots, some with tiny cubic pyrite in center. Claystone layer in Glance Conglomerate.
124						10 R 5/3	W	Weak red siltstone to sandy mudstone. Few cream colored ≤ 2mm reduction spots and bleaching along micro fractures. One slickenside surface. Mudstone layer in the Glance Conglomerate.
130						10 R 5/2 10 R 6/2	W	Weak red to pale red conglomerate. Pinal Schist phyllite, quartz, quartzite, and reddish brown sandy siltstone. The sandy siltstone is as above, and is matrix material to the pebble clasts. One slickenside surface on siltstone cutting. Glance Conglomerate.
140						2.5YR 6/3	W	Light reddish brown conglomerate. Pinal Schist phyllite and quartz clasts up to 1 cm in sandy silt mixture. Some what soft matrix material is friable, falling apart during drilling. Fines locally reactive to HCl. Glance Conglomerate.
150						2.5YR 5/3	N	Reddish brown sandy siltstone. Well indurated; uniform color. Non-calcareous, but one calcite microfracture noted. Silty layer in Glance Conglomerate.
160						2.5YR 5/3	N	Reddish brown silty sandstone, poorly sorted, with few fine gravel sized clasts of quartz and phyllite (Pinal Schist). Sand grains are quartz and small phyllite lithic grains. Silty sandstone layer in Glance Conglomerate.
170						2.5YR 5/6	W	Red sandy siltstone. Sand grains are quartz with fewer phyllite lithic grains.
180						2.5YR 6/3	N	Light reddish brown conglomerate; Glance Conglomerate. Phyllite and metamorphic quartz clasts are angular to subangular, in a reddish brown silty sand matrix. Matrix material is adhered to phyllite and quartz clasts. Gravel clasts are up to 2 inches.

		GR	**SA**	**FI**				
190	Glance Conglomerate					2.5YR 5/3	W	Reddish brown conglomerate. As above; abundant sand-size quartz and phyllite grains as well as fine gravel-size clasts. Glance Conglomerate.
200						2.5YR 5/4	W	Reddish brown Glance Conglomerate. As above. Very weak HCl reaction only in fines of the matrix.
210						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Pinal Schist-derived, angular to subangular, lensoidal shaped pebble clasts in a silty, friable matrix.
220						2.5YR 4/6	W	Red broken up clayey arkosic siltstone. Siltstone contains scattered fine to medium-grained quartz and phyllite lithic sand grains. Few tiny ≤ .5 mm white reduction spots. HCl reaction in fines only. Siltstone bed in the Glance Conglomerate.
230						2.5YR 4/6	N	Red sandy, clayey siltstone. Scattered yellowish ≤3 mm reduction spots. Few fine black oxide spots. Siltstone bed in the Glance Conglomerate. Dry.
240						2.5YR 5/4	N	Reddish brown clay, silt and sand with 10% lithified chips of reddish brown clayey siltstone with few reduction spots. Sticky, cohesive, soft. Possible fault gouge, Glance Conglomerate. Dry, despite intercepting water at 225 ft bls in BMO-10GU.
250						2.5YR 6/3	N	Light reddish brown Glance Conglomerate. Angular to subrounded Pinal Schist pebbles ≤1 cm in diameter in sandy silty matrix. Loose, friable. Dry.
260						2.5YR 5/3	W	Reddish brown silty fine-grained sandstone. HCl reacts only with the fines. Sandstone bed in the Glance Conglomerate. Dry.
270						2.5YR 6/4	N	Light reddish brown conglomerate. Pinal Schist gravel and sand conglomerate clasts and reddish brown silty sandstone as above, with loose reddish brown sand, silt and clay. Loosely consolidated zone in Glance Conglomerate. Dry.
280						2.5YR 6/4	N	Light reddish brown conglomerate. Angular to subrounded clasts up to 2.5 cm; composed of Pinal Schist material (phyllite and metamorphic quartz) in a silty sand matrix. Glance Conglomerate. Dry.
290						2.5YR 5/4	N	Reddish brown conglomerate. Pinal Schist clasts up to 2.0 cm in clayey, sandy siltstone matrix. Glance Conglomerate. Dry
300						2.5YR 5/4	N	As above; sand, silt, and clay mudstone matrix. Dry.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-10GL**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
310	Glance Conglomerate					2.5YR 5/4	N	Reddish brown to red Glance Conglomerate Angular to subrounded Pinal Schist clasts up to 1 cm in mudstone (sandy, clayey siltstone) matrix. Dry.
						2.5YR 5/6		
320						2.5YR 6/4	N	Light reddish brown Glance Conglomerate. Angular chunks to subrounded pebbles of up to 2 c. Pinal Schist in silty sandstone matrix. Dry.
330						2.5YR 6/4	W	Light reddish brown Glance Conglomerate. As above with silty sand with little clay matrix, pebbles up to 1 cm. Matrix soft, friable. Dry.
340						2.5YR 6/4	N	Light reddish brown Glance Conglomerate, as above. Wet.
350						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Angular to subrounded Pinal Schist clasts, ≤1 cm diameter, in mudstone matrix. Wet.
360						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Pinal Schist clasts as above in mudstone matrix. Matrix soft, poorly indurated.
370						2.5YR 6/4	W	Light reddish brown Glance Conglomerate. Angular to subrounded ≤ 1cm pebbles and coarse sand Pinal Schist clasts in soft silty sand with little clay matrix.
380						2.5YR 6/4	W	Light reddish brown Glance Conglomerate, as above. Dry.
390						2.5YR 6/4	W	Light reddish brown Glance Conglomerate. Pinal Schist phyllite and metamorphic quartz clasts (≤ 1 cm) and a few light greenish gray quartzite clasts in sandy siltstone matrix. Conglomerate is mostly coarse clasts with little matrix material. Formation not making water.
400						2.5YR 6/3	W	Light reddish brown Glance Conglomerate as above; abundant fine gravel and coarse sand-sized Pinal Schist clasts with small amounts of indurated sandy siltstone matrix. Reddish brown color is imparted by matrix material; the Pinal Schist clasts are reddish gray (2.5YR 5/1 to 6/1).
410						2.5 YR 5/2	N	Weak red to light reddish brown Glance Conglomerate. Abundant Pinal Schist clasts mostly ≤ .5 cm with few up to 1 cm, angular to subrounded, in silty sandstone indurated light reddish brown matrix.
						2.5 YR 6/3		
420						2.5YR 5/2	N	Weak red to reddish brown Glance Conglomerate. Abundant Pinal Schist clasts (phyllite and metamorphic quartz) with small amounts of indurated reddish brown sandy siltstone matrix. Pinal Schist clasts are mostly fine gravel (≤ 1cm) and coarse sand size.
						2.5YR 5/3

430	Glance Conglomerate					2.5YR 5/2	N	Weak red to reddish brown Glance Conglomerate, as above.
						2.5YR 5/3		
440						2.5 YR 5/3	N	Reddish brown sandy siltstone with few fine gravel to coarse sand size Pinal Schist clasts. Sandy arkosic siltstone bed in the Glance Conglomerate.
450						2.5YR 5/2	W	Light reddish brown to pale red Glance Conglomerate. Abundant ≤ 1 cm Pinal Schist gravel and coarse to medium-grained sand sized clasts in clayey siltstone soft to moderately well indurated matrix. Weak HCl reaction only in matrix.
						2.5YR 5/1		
460						2.5YR 6/4	N	Light reddish brown to pale red Glance Conglomerate. As above but without HCl reactivity. First water, first sample.
						2.5YR 6/2		
470						2.5YR 6/4	N	Light reddish brown Glance Conglomerate. Angular to subrounded Pinal Schist clasts; soft silty clay coatings and balls, and reddish brown sandy siltstone chips. Siltstone chips are probably be matrix of the conglomerate.
480						2.5YR 6/4	N	Light reddish brown Glance Conglomerate. As above. Very little water, not enough to sample.
490						2.5YR 7/4	W	Light reddish brown Glance Conglomerate. Sample is clay and silt coated Pinal Schist gravel clasts (angular to subangular, up to 4 cm) and reddish brown sandy siltstone chips. Sandy siltstone matrix can be occasionally seen adhered to small phyllite clasts.
500						2.5YR 6/4	W	Light reddish brown to pale red Glance Conglomerate. As above, very weak reaction to HCl in fines only. No water.
						2.5YR 6/2		
510						2.5YR 6/3	N	Light reddish brown to weak red Glance Conglomerate. As above, very weak reaction to HCl in fines only.
						2.5YR 5/2		
520						2.5YR 5/1	N	Reddish brown, weak red to reddish gray conglomerate. Sample is mostly ≤ l cm chips of weak red to reddish brown sandy siltstone with lesser Pinal Schist (reddish gray phyllite and white metamorphic quartz) and trace light gray quartzite. Sandy conglomeratic siltstone layer in the Glance Conglomerate.
						2.5YR 5/2		
						2.5YR 5/3		
530						2.5YR 5/2	N	Weak red to pale red Glance Conglomerate. Abundant ≤ 1 cm angular to subrounded lensoidal phyllite (Pinal Schist) conglomerate clasts with 15% sandy siltstone matrix.
						2.5YR 6/2		
540						2.5YR 5/2	N	Weak red to pale red Glance Conglomerate. As above
						2.5YR 6/2		
550						2.5YR 5/1	W	Reddish gray, weak red, to reddish brown Glance Conglomerate. As above. Sandy siltstone matrix occasionally can be seen adhered to Pinal Schist clasts. Trace clear calcite veinlets.
						2.5YR 5/2

		GR	**SA**	**FI**				
560	Glance Conglomerate					2.5YR 5/3	W	Reddish brown Glance Conglomerate. Pinal Schist clasts up to l cm, with abundant coarse sand size phyllite lithic grains and about 5% white quartz in a sandy, clayey, silty mudstone matrix. Matrix is more clay-rich compared to previous (510' - 550') intervals. HCl reaction restricted to clayey matrix. Formation beginning to make water.
570						2.5YR 6/3	N	Light reddish brown silty sand. Loose fine to coarse sand with few fine gravel clasts consisting of angular to subangular phyllite and quartz grains derived from Pinal Schist. Poorly indurated sandy bed in Glance Conglomerate.
580						2.5YR 5/1 2.5YR 5/2 2.5YR 5/3	N	Reddish gray, weak red, to reddish brown conglomerate composed of e, ≤ 1 cm of phyllite and little quartz (derived from Pinal Schist) in sandy siltstone matrix. Matrix material is moderately well indurated as in 510-550 intervals. Phyllite clasts are reddish gray to weak red; matrix is reddish brown. Glance Conglomerate.
590						2.5YR 6/3 2.5YR 6/2	W	Light reddish brown to pale red Glance Conglomerate. As above but with small amount of slightly calcareous clay. Very little water.
600						2.5YR 5/3	W	Reddish brown Glance Conglomerate. Loose silty sand with gravel composed of quartz, phyllite lithic grains and sandy siltstone particles (matrix of conglomerate). Poorly indurated and/or ground up by the drilling process.
610						2.5YR 5/3	N	Reddish brown Glance Conglomerate. Pinal Schist-derived phyllite and metamorphic quartz, and rare granular quartzite clasts in sandy siltstone matrix. Few chunks ≤ 2 cm of Pinal Schist and matrix material; but most of sample is sand-size particles possibly due to grinding during drilling.
620						2.5YR 5/3	N	Reddish brown Glance Conglomerate. As above. Formation dry again.
630						2.5YR 6/3	N	Light reddish brown Glance Conglomerate. As above; ground up; small coarse sand-size phyllite lithic grains locally seen in sandy siltstone matrix.
640						2.5YR 5/2	N	Weak red Glance Conglomerate. As above, grayer in color; appears to be ground up from drilling.
650						2.5YR 5/2	N	Weak red Glance Conglomerate. As above.
660						2.5YR 5/2 2.5YR 5/3	N	Weak red to reddish brown Glance Conglomerate. Sample contains more gravel-size particles; appears less ground up. Sample is composed of angular to subangular Pinal Schist phyllite and metamorphic quartz pebbles, tabular to lensoidal in shape; with 5% sandy siltstone indurated matrix material.
670						2.5YR 6/3	N	Light reddish brown Glance Conglomerate. As above.

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
0	Basin Fill	50	30	20	GM	2.5YR 5/6	S	Red gravel with sand, caliche cement. Gravel clasts are angular to sub-rounded, poorly sorted, composed of yellow silicified limestone, gray micritic, oolitic, and recrystallized limestone; chert, quartzite, reddish gray sandstones, vein quartz, and phyllite. Limestone clasts are most abundant, with lesser phyllite, and smaller amount of clastic sediments. Jarosite and gypsum precipitate from the former evaporation pond are also locally present as a weak cement. Sand fraction is angular to subrounded, coarse to fine-grained, poorly graded quartz and lithic grains.
1		80	15	5	GP	7.5YR 6/4 7.5YR 6/6	S	Light brown to reddish yellow gravel with sand; strong caliche cement. Gravel clasts are angular to subangular, composed of quartz, silicified limestone, fine-grained reddish gray sandstone, quartzite, and phyllite. Phyllite and some quartz is derived from the Pinal Schist; other clasts from Paleozoic and Mesozoic sedimentary formations. Black oxide coatings and jarosite stain are common. Sand grains are angular to subrounded, poorly sorted, coarse to fine-grained, but mostly coarse grained, composed mostly of light brown to reddish yellow lithic grains and quartz.
3		65	20	15	GM	7.5YR 6/3	S	Light brown silty gravel with sand, caliche cement. Gravel is subangular to angular silicified limestone, limestone, chert, phyllite, and milky massive quartz. Caliche chunks are generated by drilling. Sand is angular to subrounded, coarse to fine-grained lithic grains and quartz.
10		55	35	10	GW-GM	2.5YR 7/4	S	Light reddish brown gravel with silt and sand, caliche cement. Gravel is angular to subrounded, composed of limestone, silicified limestone, phyllite, reddish brown sandstone, and quartzite; caliche chunks generated by drilling. Sand fraction is coarse to fine-grained, well-graded, angular to subrounded quartz and lithic grains. Coarser sand fraction is dominated by lithic grains; finer sand has a greater amount of quartz grains.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-10GU**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
20	Basin Fill	5	70	25	SM	2.5YR 8/3	S	Pink silty sand; caliche cement. Gravel clasts are pebble sized, subangular to subrounded; composition is polymictic with lithologies as listed above. Sand is subangular to rounded lithic and quartz grains.
30		15	60	25	SM	2.5YR 7/4	S	Light reddish brown silty sand with gravel, caliche cement. Some swelling clays in the fine fraction, mixed with caliche. Sand is primarily fine-grained, well-graded through to silt.
40			35	65	ML	2.5YR 6/4	S	Light reddish brown sandy silt. Silt is calcareous. Sand fraction is mostly medium to fine-grained, mostly lithic grains with lesser quartz grains. Lithic grains include reddish brown, gray to white sandstone and siltstone, caliche particles, phyllite, quartzite and trace limestone. Most sand grains are angular to subangular.
50		tr	35	65	ML	2.5YR 7/3	S	Light reddish brown sandy silt; caliche cement. Sand is coarse to fine-grained, composed of lithic grains and quartz. Trace gravel and lithic sand grains are composed of abundant gray, pink, and reddish brown fine-grained sandstone and quartzite, with lesser amounts of phyllite and limestone. Caliche is well indurated, drilling as chunks and chips.
60		50	30	20	GC	2.5YR 6/4	S	Light reddish brown clayey gravel with sand. 20% sandy clay balls. Gravel is polymictic, composed of abundant quartzite, reddish brown fine-grained sandstone; moderate amount of phyllite, schist metamorphic quartz, with lesser gray limestone with trace oxidized pyrite, and trace amounts of reddish brown volcanic and green siltstone. Sand is composed of quartz and lithic grains. Clays swell in water. Caliche is well indurated, drilling as chunks.
70		30	40	20	SM	2.5YR 7/3	S	Light reddish brown silty sand with gravel. Sand and gravel compositions are as above with slightly more limestone and a small amount of chert in the gravel fraction. 20% sandy swelling clay balls.
75			55	45	SC	2.5YR 6/3	S	Light reddish brown clayey sand; some silt. Clays are calcareous, swelling. Sand is medium- to fine-grained, subangular to rounded, composed of quartz and lithic grains including white, reddish brown, gray, and green sandstone, siltstone, and quartzite.
77		65	30	5	GP	2.5YR 6/4	M	Light reddish brown gravel with sand. Gravel is 95% reddish brown, pink, gray, and greenish gray sandstone and siltstone. Remainder is phyllite, limestone and chert with rare reddish fine-grained volcanics. Clasts are mostly subangular with some angular material. Sand fraction is coarse- to fine-grained, but mostly coarse lithic grains. Few thin calcite and caliche coatings on clasts; caliche cement is weak.
80		65	25	10	GP-GC	2.5YR 6/4	M	Light reddish brown gravel with clay and sand. Gravel is pebble-sized, polymictic, composed of sandstone, siltstone, phyllite, with little limestone and chert. Sand is composed primarily of coarse lithic grains of same composition.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-10GU**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
81	Basin Fill	85	10	5	GP	mottled	M	Mottled reddish brown, gray, black, pink and white gravel. Gravel is poorly graded, mostly subangular, polymictic, composed of reddish brown and gray limestone, black chert, white to pink silicified limestone, and pinkish gray phyllite. Clasts are equidimensional to elongate up to 2 1/2" on long side. Few thin calcite coatings.
90		80	10	10	GP-GC	2.5YR 7/3	M	Light reddish brown gravel with clay. Gravel is mostly subangular with few subrounded clasts composed of reddish brown to gray sandstone, greenish gray quartzite, gray phyllite, and limestone. Clay is calcareous, sticky, cohesive.
100		20	60	20	SC	2.5YR 5/4	W	Reddish brown clayey sand with gravel. Gravel is angular to subrounded pebbles, primarily of phyllite, little quartz, silty reddish brown sand, poorly sorted. Uniform color. Sand is mostly coarse-grained, lithic grains poorly sorted, subangular.
110		25	65	10	SW-SM	2.5YR 6/6	N	Light red sand with silt and gravel. Gravel is composed of phyllite and metamorphic quartz derived from Pinal Schist, and reddish brown poorly sorted sandstone with manganese oxide spots. Sand is mostly coarse-grained, subangular, poorly graded and sorted, composed primarily of lithic grains with few quartz grains.
120		10	80	10	GP-GC	2.5YR 6/6	N	Light red gravel with clay. Gravel is angular to subrounded, composed of Pinal Schist clasts. Some silt and sand adhered to phyllite clasts. Probably rubble near the top of the Glance Conglomerate.
130	Glance Conglomerate				bedrock	2.5YR 5/4	N	Reddish brown Glance Conglomerate. Pinal Schist (phyllite and metamorphic quartz) clasts in reddish brown silty sandstone matrix. Uniform coloration.
140						2.5YR 5/3 2.5YR 5/2 2.5YR 6/1	N	Reddish brown, weak red, to reddish gray Glance Conglomerate. Gravel-sized clasts are primarily Pinal Schist with little metamorphic quartz and quartzite (possibly derived from the Bolsa Quartzite) in a silty sandstone matrix. Trace white crystalline calcite in the matrix.
150						2.5YR 5/4	N	Reddish brown Glance Conglomerate, composition as above. Conglomerate clasts are up to 2 cm in diameter, and are angular to subrounded, locally with some rounded surfaces.
160						2.5YR 5/2 2.5YR 5/4	N	Reddish brown to weak red Glance Conglomerate. Mostly pebble-size phyllite and little metamorphic quartz derived from Pinal Schist and few quartzite clasts in a sandy siltstone matrix.
170						2.5YR 5/4	N	Reddish brown to weak red Glance Conglomerate, as above; abundant Pinal Schist phyllite and quartz, with little sericitic sandstone and quartzite in reddish brown sandy siltstone matrix.
180						2.5YR 5/3	N	Reddish brown silty and clayey sandstone; sand grains are mostly fine-grained with scattered coarser clear quartzite lithic grains. Sandstone bed in the Glance Conglomerate.

190	Glance Conglomerate					2.5YR 5/6	N	Red Glance Conglomerate. Conglomerate is composed of primarily subangular to angular phyllite and metamorphic quartz with few coarse-grained white quartzite gravel in a silty sandstone matrix.
200						2.5YR 6/3	N	Light reddish brown Glance Conglomerate, Pinal Schist pebbles and coarse sand-sized lithic grains in fine silty sandstone matrix.
210						2.5YR 4/3	N	Reddish brown silty clayey fine-grained sandstone. Mudstone layer within the Glance Conglomerate.
220						2.5YR 5/3	N	Reddish brown Glance Conglomerate, composed of up to 3 cm, phyllite, metamorphic quartz, micaceous quartzite, and rare coarse- grained arkose gravel clasts in a silty sandstone matrix.
230						2.5YR 5/4	N	Reddish brown Glance Conglomerate, as above.
240						2.5YR 5/3	N	Reddish brown Glance Conglomerate, as above with finer gravel pebbles up to 1 cm on long side.
242						2.5 YR 4/4	N	Reddish brown silty fine-grained sandstone, slightly micaceous. Sandstone layer in the Glance Conglomerate.
250						2.5YR 5/4	N	Reddish brown Glance Conglomerate; Pinal Schist phyllite and metamorphic quartz gravel in a sandy silt clayey matrix.
260						2.5YR 6/3	N	Light reddish brown Glance Conglomerate; Pinal Schist phyllite and metamorphic quartz, and few quartzite clasts in a sandy silt and clay mudstone matrix.
270						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Abundant Pinal Schist (phyllite and metamorphic quartz), with little matrix material.
280						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Abundant Pinal Schist and rare white quartzite pebbles in silty sandstone matrix.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-10GU**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
290	Glance Conglomerate					2.5YR 5/4	N	Reddish brown Glance Conglomerate. Pinal Schist clasts in fairly hard, poorly sorted silty sandstone matrix.
300						2.5YR 5/3	N	Reddish brown Glance Conglomerate. As above.
310						2.5YR 5/3	N	Reddish brown Glance Conglomerate, as above. Pinal Schist phyllite and metamorphic quartz clasts are angular to subangular, up to 2 cm on a long side, grading to coarse sand, in a silty sandstone matrix.
320						2.5YR 5/3	N	Reddish brown Glance Conglomerate, Pinal Schist clasts in mudstone matrix; abundant matrix material, fewer pebbles.
330						2.5YR 6/3	N	Light reddish brown Glance Conglomerate, abundant fine gravel and coarse sand-size Pinal Schist clasts in silty sandstone matrix.
340						2.5YR 6/3	N	Reddish brown Glance Conglomerate. Mostly coarse sand-sized and fine pebble-size particles of Pinal Schist in silty sandstone matrix.
350						2.5YR 6/3	N	Reddish brown Glance Conglomerate, mostly coarse sand-size Pinal Schist clast with few pebbles in silty sandstone matrix.
360						2.5YR 6/3	N	Reddish brown Glance Conglomerate. Pinal Schist clasts are mostly fine-to coarse-grained sand-sized particles with few pebbles in a silty and clayey sandstone matrix.
370						2.5YR 6/3	N	As above, abundant pebbles.
380						2.5YR 5/3	N	Reddish brown Glance Conglomerate. Sand and small pebble Pinal Schist (phyllite and metamorphic quartz) clasts in silty sandstone matrix. Abundant sandy matrix material.
390						2.5YR 5/3	N	Reddish brown Glance Conglomerate. Abundant Pinal Schist pebbles and coarse to fine sand-size lithic grains in sandy mudstone matrix.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-10GU**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
400	Glance Conglomerate					2.5YR 5/3	N	Reddish brown Glance Conglomerate. Angular to subrounded pebbles and sand-sized material derived from Pinal Schist in sandy siltstone matrix.
410						2.5YR 6/4	N	Light reddish brown Glance Conglomerate. Subangular to subrounded Pinal Schist clasts, mostly coarse sand-size, with some pebbles up to 1 cm diameter, in a sandy siltstone matrix.
420						2.5YR 5/3	N	Reddish brown Glance Conglomerate, as above. Rig chatter at 425' indicates presence of coarse cobble zone in the conglomerate.
430						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Few angular Pinal Schist phyllite and quartz clasts up to 1cm in clayey siltstone.
440						2.5YR 6/4	N	Light reddish brown Glance Conglomerate. Silt, clay, and sand mudstone with scattered fine pebble and coarse sand-sized Pinal Schist clasts. Rig chatter at 445 ' indicates presence of a coarse cobble zone in the conglomerate.
450						2.5YR 5/3	N	Reddish brown Glance Conglomerate. Sample is largely angular to subangular Pinal Schist pebbles and coarse lithic sand grains, with about 10% sandy silt matrix material.
460						2.5YR 6/4	N	Light reddish brown Glance Conglomerate, as above with a silt, sand and clay mudstone matrix.
470						2.5YR 6/4	N	Reddish brown Glance Conglomerate. As above with clayey, silt and sand mudstone matrix.
480						2.5YR5/3	N	Reddish brown Glance Conglomerate. Sample is mostly ground up Pinal Schist phyllite and quartz, and white granular quartzite (possibly derived from the Bolsa Quartzite). Gravel and coarse sand in a fairly well-indurated sandy siltstone matrix.
490						2.5YR 4/2	N	Weak red Glance Conglomerate. Sample is mostly ground up Pinal Schist sand and pebble size fragments with little sandy siltstone matrix material.
500						2.5YR 5/3	N	Reddish brown Glance Conglomerate, as above. Attempted to changed drilling method from conventional rotary to reverse circulation with tricone; RC attempt was unsuccessful due to the low water production by the formation.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-10GU**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
510	Glance Conglomerate					2.5YR 5/3	N	Reddish brown Glance Conglomerate. Abundant subangular to subrounded pebble (< 2 cm) conglomerate. Pebbles are phyllite and metamorphic quartz derived from the Pinal Schist with few white granular quartzites. Little matrix material.
520						2.5YR 5/3	N	Reddish brown Glance Conglomerate, as above.
530						2.5YR 5/4 2.5YR 6/6	W	Reddish brown Glance Conglomerate; portions of fine matrix material are light red. Subangular pebble conglomerate; clasts up to 1.5cm diameter in a silt, clay, and sand mudstone matrix.
540						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Sample is mostly angular to subrounded, coarse sand-size particles with few pebbles of Pinal Schist (phyllite and metamorphic quartz) and granular quartzite.
550						2.5YR 5/4	N	Reddish brown Glance Conglomerate, as above.
560						2.5YR 5/3	N	Reddish brown Glance Conglomerate. Mostly medium to coarse grained sand-sized particles with few angular to subrounded pebbles; derived from Pinal Schist.
570						2.5YR 5/4	N	Reddish brown Glance Conglomerate. Angular to subangular, coarse sand and gravel sized Pinal Schist-derived material in silty matrix..
580						2.5YR 5/4	N	Reddish brown Glance Conglomerate, as above.
590						2.5 YR 5/6	N	Red Glance Conglomerate. Pebbles and coarse sand-sized subrounded phyllite and quartz clasts derived from the Pinal Schist in a red siltstone matrix.
600						2.5YR 5/4	W	Reddish brown Glance Conglomerate. Mostly sand-sized particles with few fine pebbles derived from the Pinal Schist in a silt, sand and clay mudstone matrix. Clay is slightly calcareous.
610						10R 6/3	N	Pale red Glance Conglomerate. Sample is mostly loose fine to coarse sand with 10% subangular gravel derived from the Pinal Schist and 15% siltstone matrix material.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-10GU**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
620	Glance Conglomerate					10R 6/3	N	Pale red Glance Conglomerate. As above with 30% gravel-sized clasts.
630						2.5YR 7/4	W	Light reddish brown Glance Conglomerate. Mostly sand-sized Pinal Schist clasts in silty, clayey matrix. Clayey matrix slightly calcareous.
640						2.5YR 6/4	W	Light reddish brown Glance Conglomerate. Medium to coarse sand sized particles and fine angular to subrounded pebbles derived from Pinal Schist in silty clayey matrix.
650						2.5YR 6/4	W	Light reddish brown Glance Conglomerate, as above.
660						2.5YR 6/4 2.5YR 6/1	N	Light reddish brown to reddish gray Glance Conglomerate. Angular to subangular chips of Pinal Schist and rare quartz in siltstone matrix. Matrix is reddish brown, clasts are mostly reddish gray.
670						2.5YR 6/4	W	Light reddish brown Glance Conglomerate. Angular to subangular coarse sand and gravel derived from Pinal Schist in silty, slightly clayey and sand mudstone matrix. HCl, reacts with matrix material only. Clasts are reddish gray, matrix reddish brown.
680						2.5YR 6/4	W	Light reddish brown Glance Conglomerate, as above.
690						10R 6/3	W	Pale red Glance Conglomerate, as above, occasional Pinal Schist clasts up to 3 cm on long side.
700						2.5YR 6/3	W	Light reddish brown Glance Conglomerate. Angular to subangular Pinal Schist clasts up to 1 cm in reddish brown silty sandstone matrix. Formation is producing very little water. TD = 700 ft bls at 13:40 on 6/29/2008

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
0	Basin Fill	20	20	60	ML	7.5YR 5/4	S	Brown sandy silt with gravel. Gravel clasts are up to 3" diameter, few cobbles to 6", angular to well-rounded; composed primarily of dark through light gray limestone, with some fine to medium-grained sandstone. Sand fraction is medium to very fine-grained. Material is loose, dry; strong reaction to HCl.
10		35	40	25	SM	7.5YR 8/1	S	White silty sand with gravel; caliche cement. Gravel clasts are up to 1" in diameter, angular to rounded, primarily composed of dark through light gray crystalline limestone, some reddish sandstone; small amount of chert. Sand fraction is coarse through fine-grained, cemented with white caliche, soft, dry; very strong reaction to HCl.
20		15	25	60	ML	7.5YR 7/2	S	Pinkish gray sandy silt with gravel; caliche cement. Gravels and sands are as described above, powdery, flour-like texture, ground up caliche, dry; very strong reaction to HCl.
30		5	25	70	ML	7.5YR 6/3	S	Light brown sandy silt; caliche cement, trace gravel. Gravel clasts are up to 1/2" diameter, composed primarily of gray limestone. Sand fraction is primarily fine to very fine-grained, powdery flour-like texture, dry; very strong reaction to HCl.
40			10	90	ML	7.5YR 7/2	S	Pinkish gray silt; caliche ground to a silt during drilling; powdery flour-like texture, dry; very strong reaction to HCl.
50		40	20	40	GM	7.5YR 7/2	S	Pinkish gray silty gravel with sand; caliche-cement. Gravel clasts are up to 2" diameter, angular to well-rounded, composed of primarily light through dark gray crystalline limestone with quartz, arkose, some reddish mudstone. Sand fraction is coarse through fine-grained; silt fraction is primarily ground up calcareous cement; dry; very strong reaction to HCl.

60	Basin Fill	5	20	75	ML	7.5YR 6/3	S	Light brown caliche-cemented silt with sand. Gravel clasts are up to 1/2" diameter; primarily limestone. Sand fraction is mostly fine-grained. Fine fraction is ground up caliche cement, powdery, flour-like texture, dry; very strong reaction to HCl.
70		15	20	65	ML	7.5YR 6/3	S	Light brown silt with sand, caliche cement. As above, except that gravel fraction has increased.
80		30	20	45	ML	7.5YR 6/3	S	Light brown gravelly silt with sand, caliche cement.
90		25	20	55	ML	7.5YR 6/3	S	Light brown gravelly silt with sand, caliche cement.
100		35	20	45	ML	7.5YR 6/3	S	Light brown gravelly silt with sand, caliche cement. Similar to above except that gravels are large, up to 2" diameter, primarily dark through light gray limestone, some quartz, chert, and fine-grained sandstone. Dry, very strong reaction to HCl.
110		80	10	10	GW-GM	Mottled	S	Mottled gravel with silt. Light to dark gray and red; gravel to 2", angular to subrounded, gray limestone, dark red fine-grained sandstone, few cherty clasts. Few gravel clasts coated with carbonate. Loose, dry, strong reaction to HCl.
120		60	20	20	GW	7.5YR 6/3	S	Light brown silty, gravel with sand. Gravel fraction is angular to subrounded, fine-grained up to 1/2" diameter, primarily dark through light gray limestones, some quartz, chert, fine-grained sandstones. Sand fraction is coarse through fine-grained; fines are as a carbonate, dry, very strong reaction to HCl.
130		80	10	10	GW-GM	Mottled	S	Mottled gravel with silt, as described for the 110' bls depth.
140		50	25	25	GM	2.5YR 6/2	S	Pale red silty gravel with sand. Gravel to 1/2", angular to rounded; dark to light gray with whitish and reddish limestone, some quartz and fine-grained reddish sandstone with calcareous cement. Sand coarse to very fine-grained; fines are a calcareous silt; dry, very strong reaction to HCl.
150		10	50	40	SM	2.5YR 6/2	S	Pale red silty sand. Gravel clasts are up to 1/2" diameter, angular to fairly well-rounded, primarily as dark through light gray limestone, some reddish fine-grained calcareous sandstone, few quartz. Sand fraction is coarse through very fine-grained, but is primarily silty, dry, strong reaction to HCl.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-11G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
160	Basin Fill	30	40	30	SM	2.5YR 6/3	S	Light reddish brown silty sand with gravel. As described above, except for an increase in the gravel fraction and a corresponding decrease in the sand and silt fractions.
170		30	40	30	SM	2.5YR 6/3	S	Light reddish brown silty sand with gravel, as above.
180		30	40	30	SM	2.5YR 6/3	S	Light reddish brown silty sand with gravel, as above.
190		50	25	25	GM	7.5YR 5/4	S	Brown silty gravel with sand. Gravel fraction to 1", angular to rounded, dark to light gray, whitish and reddish limestones, reddish fine-grained calcareous cemented sandstones; carbonate coated clasts. Sand coarse to very fine-grained, siltly calcareous fines; dry, very strong reaction to HCl.
200		75	15	10	GW-GM	2.5YR 4/3	S	Reddish brown gravel with silt and sand, gravel fine grained, to 1"; angular to well rounded, clasts of Pinal Schist; reddish fine-grained calcareous sandstone, dark to light gray limestone, and few pale green argillite pieces. Sand coarse to very fine-grained, trace calcareous silt, dry, strong reaction to HCl.
210		15	35	50	ML	2.5YR 5/3	S	Reddish brown sandy silt with gravel. Gravel to 1/2", angular to rounded, lithology includes calcareous sandstone, siltstone, and mudstone, Pinal Schist with quartz and limestone fragments; Sand fine to very fine-grained; Silty calcareous fines; dry, strong reaction to HCl.
220		15	35	50	ML	2.5YR 5/3	S	Reddish brown sandy silt with gravel, as above. Gravel clasts are primarily Pinal Schist and limestone. Few calcite-sand cement coatings.
230		30	55	15	SM	2.5YR 6/3	S	Light reddish brown silty sand with gravel. Gravel to 1/2", angular to rounded, clasts are fine-grained sandstone with calcareous cement, quartz, and siltstone; Sand mostly coarse to fine-grained, Silty calcareous fines; dry, strong reaction to HCl.
240	Morita Formation				Bedrock	2.5YR 6/3	S	Light reddish brown arkosic sandstone, fine-grained, calcareous cement, fairly soft, platy, dry, strong reaction to HCl. Morita Formation, upper contact with basin fill.
250						2.5YR 5/4	S	Reddish brown mudstone. Platy, calcareous, fairly soft, homogenous, dry, strong reaction to HCl. Morita Formation.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-11G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
260	Morita Formation					2.5YR 5/3	S	Reddish brown mudstone, weakly indurated, slightly laminated, platy, soft, dry, strong reaction to HCl. Morita Formation.
270						2.5YR 5/3 2.5YR 7/1	S	Reddish brown and light reddish gray siltstone and sandstone. Siltstone is as described above except that it is considerably harder, and has few bleached spots. Sandstone is composed of light gray quartz, fine-grained with calcareous cement, fairly hard, platy, dry, strong reaction to HCl. Morita Formation.
280						2.5YR 5/3	S	Reddish brown siltstone, weakly laminated, platy, fairly soft, dry, strong reaction to HCl. Morita Formation.
290						2.5YR 5/3	M	Reddish brown silty sandstone, fine-grained, calcareous cement, slightly platy, homogenous, fairly soft, can be broken with fingers; dry, moderate reaction to HCl. Morita Formation.
300						2.5YR 5/3	M	Reddish brown fine-grained sandstone, as above.
310						2.5YR 4/2	M	Weak red fine-grained silty sandstone, as above; with few small bleached spots.
320						2.5YR 4/2	M	Weak red silty sandstone with about 15-20% gray, micritic limestone, possibly occuring as nodules. Silty sandstone is very similar to above except that it tends to be finer grained and somewhat more silty. Moderate reaction to HCl.
330						2.5YR5/3	M	Reddish brown siltstone. As above except that light greenish gray, sandstone has diminished to less than 1%.
340						2.5YR 4/3	M	Reddish brown sandstone, fine grained, calcareous cement, platy, fairly hard, small amount (<1%) of a light gray quartz sandstone; strong reaction to HCl. Driller is injecting water to wet cuttings.
350						2.5YR 4/3	S	Reddish brown siltstone, platy, very weakly laminated, fairly soft, calcareous cement; very strong reaction to HCl.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-11G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
360	Morita Formation					2.5YR 4/2	S	Weak red silty sandstone. Platy, calcareous cement, hard; 20% light gray limestone, possibly occuring as nodules. Strong reaction to HCl.
370						2.5YR 4/3	S	Reddish brown sandstone with 10% gray limestone.
380						2.5YR 4/3	S	As above.
390						2.5YR 4/3	S	Reddish brown silty sandstone, fine-grained, platy, calcareous cement, fairly homogenous, moderately hard; strong reaction to HCL.
400						2.5YR 4/3	S	As above.
410						2.5YR 4/2	S	Weak red silty fine-grained sandstone. Mostly quartz with a few percent feldspar grains in a calcareous matrix.
420						2.5YR 4/2	S	Weak red silty fine-grained sandstone. As above.
430						2.5YR 4/2	S	Weak red silty fine-grained sandstone. As above.
440						2.5YR 4/2	S	Weak red silty fine-grained sandstone. Mostly quartz with a few percent feldspar grains in a calcareous matrix.
450						2.5YR 4/2	M	Weak red silty, clayey fine-grained sandstone.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-11G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
460	Morita Formation					2.5YR 4/2	M	Weak red sandstone, fine-grained, calcareous cement, slightly platy, fairly hard, homogenus. Moderate reaction to HCL.
470						2.5YR 4/2	M	Weak red sandstone, fine-grained but slightly coarser than above, platy, calcareous cement, fairly hard, homogenous, moderate reaction to HCl. Morita Formation.
480						2.5YR 4/2	M	Weak red brown fine-grained sandstone, as above. Morita Formation.
490	Glance Conglomerate					2.5YR 5/4	N	Reddish brown pebbly sandstone. Mix of poorly sorted sandstone, quartz, dark gray translucent chert, and Pinal Schist. Small saturated zone from 480 - 490'. Except for a few grains of limestone, no reaction to HCl. Glance Conglomerate.
500						2.5YR 4/4	N	Reddish brown sandstone. Medium to fine-grained, poorly sorted, siliceous cement, platy, moderately hard. No reaction to HCl. Glance Conglomerate. First Water Sample.
510						2.5YR 5/4	N	Reddish brown conglomerate. Pinal Schist, quartz, chert gravel clasts in silty arkosic sandstone matrix. Sandstone matrix is medium to fine-grained, poorly sorted, with siliceous cement. No reaction to HCl. Glance Conglomerate.
520						2.5YR 4/4	N	Reddish brown sandy siltstone. Sand is mostly very fine-grained with occasional coarser quartz and lithic grains; siltstone is platy, fairly soft, can easily be broken by hand. No reaction to HCl. Glance Conglomerate.
530						2.5YR 3/4	N	Dark reddish brown sandy siltstone. As described above except not quite as platy and considerably harder. Glance Conglomerate.
540						2.5YR 3/4	N	Dark reddish brown conglomerate. Abundant phyllite, schist, and metamorphic quartz derived from the Pinal Schist in a medium to fine-grained, poorly sorted, silty sandstone matrix with siliceous cement. No reaction to HCl. Glance Conglomerate.
550						2.5YR 3/4	N	Dark reddish brown conglomerate, as described above. Glance Conglomerate.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-11G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
560	Glance Conglomerate					2.5YR 4/4	N	Reddish brown arkosic sandy siltstone. Sandy siltstone has siliceous cement; sand is mostly fine-grained quartz with few medium lithic grains; is platy, fairly soft; has few small light colored reduction spots. No reaction to HCl. Glance Conglomerate.
570						2.5YR 4/3	N	Reddish brown sandy siltstone. As above, very slight laminations detectable on larger chips. Glance Conglomerate.
580						2.5YR 4/3	N	Reddish brown sandy siltstone. As above except that few chips have a light gray soft opaque coatings on some surfaces, may be gypsum fracture fillings. Glance Conglomerate.
590						2.5YR 4/3	N	Reddish brown fine-grained silty arkosic sandstone. Glance Conglomerate.
600						2.5YR 4/3	N	Reddish brown sandy siltstone. Glance Conglomerate.
610						2.5YR 4/3	N	Reddish brown sandy siltstone. Glance Conglomerate.
620						2.5YR 3/4	N	Dark reddish brown conglomerate, mix of schist, phyllite, quartz, and chert pebble clasts in a fine-grained, poorly sorted sandstone to siltstone matrix. No reaction to HCl. Glance Conglomerate.
630						2.5YR 3/4	N	Dark reddish brown conglomerate, as above. Glance Conglomerate.
640						2.5YR 4/4	N	Reddish brown sandy siltstone. Sand is very fine-grained, siltstone has very weak laminations, is platy, fairly soft; few surfaces exhibit soft whitish gypsum coatings, siliceous cement. No reaction to HCl. Glance Conglomerate.
650						2.5YR 4/4	N	Reddish brown sandy siltstone, as above. Glance Conglomerate.

670						2.5YR 4/3	N	Reddish brown conglomerate. Pinal Schist (phyllite and quartz) with lesser gray chert pebbles and fragments in a poorly sorted, medium to very fine-grained silty sandstone matrix with silica cement; fairly hard. No reaction to HCl. Glance Conglomerate.
680						2.5YR 4/3	N	Reddish brown conglomerate, as described above. Glance Conglomerate.
690						2.5YR 4/3	N	Reddish brown sandstone, poorly sorted, fine to very fine-grained. Slightly platy, fairly hard, siliceous cement. No reaction to HCl. Glance Conglomerate.
700						2.5YR 4/2	N	Weak red conglomerate with sandstone matrix. Matrix is fairly well-graded, moderately hard, medium to fine-grained sandstone with siliceous cement. Conglomerate clasts are composed of numerous dark gray through white quartz, schist and phyllite, and little chert. No reaction to HCl. Glance Conglomerate.
710						2.5YR 4/3	N	Reddish brown conglomerate, as above. Glance Conglomerate.
720						2.5YR 4/4	N	Reddish brown silty arkosic sandstone. Fine to very fine-grained, fairly well-graded, platy, homogenous, fairly hard, siliceous cement. No reaction to HCl. Glance Conglomerate
730						2.5YR 4/4	N	Reddish brown sandy siltstone. Sand is very fine-grained; siltstone is platy, fairly hard but can be broken by hand, siliceous cement. No reaction to HCl. Glance Conglomerate
740						2.5YR 4/4	N	Reddish brown sandy siltstone, as above. Glance Conglomerate.
750						2.5YR 4/3	N	Reddish brown conglomerate. Quartz and schist clasts in a medium to very fine-grained, fairly well-graded sandstone matrix composed of mostly of quartz grains with few limestone lithic grains; siliceous cement. No reaction to HCl except for limestone grains. Glance Conglomerate.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-11G**

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
760	Glance Conglomerate					2.5YR 4/4	N	Reddish brown sandy siltstone. Sand fraction is fine to very fine-grained, platy, siliceous cement, fairly hard, does not react with HCl except for a very few individual limestone grains. Few 1 mm light colored reduction spots. Glance Conglomerate.
770						2.5YR 4/4	N	Reddish brown sandy siltstone. As above. Glance Conglomerate.
780						2.5YR 4/4	N	Reddish brown sandstone. Sandstone is fine to very fine-grained, with calcareous cement, slightly platy, moderately hard, few grayish quartzite and phyllite fragments. No reaction to HCl. Glance Conglomerate.
790						2.5YR 4/3	N	Reddish brown conglomerate. Conglomerate clasts are schist and quartz derived from the Pinal Schist, in a poorly sorted, fine to very fine-grained silty arkosic sandstone matrix; material is moderately hard. No reaction to HCl. Glance Conglomerate.
800						2.5YR 4/3	N	Reddish brown conglomerate; as above. Glance Conglomerate
810						2.5YR 5/3	N	Reddish brown conglomerate. Abundant Pinal Schist pebbles. As above, but sandy matrix is somewhat coarser grained. No reaction to HCl. Glance Conglomerate
820						2.5YR 5/3	N	Reddish brown conglomerate, as above. Glance Conglomerate. TD = 820 ft at 8:41 on 7/31/2008

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
10	Basin Fill	65	25	10	GP	2.5YR 8/3	S	Pink, strongly cemented gravel with clay and sand. Angular broken to subrounded clasts of gray limestone gray chert, pink, white to gray fine-grained sandstone, gold siltstone, sand to gravel sized, cemented with hard caliche.
20		25	55	20	SM	5YR 7/3	S	Pink, strongly cemented silty sand with gravel. Gravel and lithic sand grains are angular to subrounded, composed primarily of gray to pinkish gray limestone with a little chert, fine grained sandstone, and white quartzite clasts, cemented with caliche. Caliche is softer and more clayey than above.
30		5	50	45	SC	5YR 7/4	S	Pink, strongly cemented clayey sand. Sample is mostly moderately well indurated broken chunks (generated by drilling) of sandy clayey caliche and few limestone chips.
40		10	25	65	CL	7.5YR 5/4	S	Brown, strongly cemented sandy clay with gravel. Sample is ground up (by drilling) clayey sandy caliche with angular freshly broken gravel clasts composed of gray limestone and a small amount of chert.
50		25	33	40	SC	5YR 6/4		Reddish brown, strongly cemented clayey sand with gravel. Gravel is mostly brown gray limestone with little gray sandstone and reddish brown sandy siltstone.
60		25	40	35	SM	5YR 6/3	S	Light reddish brown, strongly cemented sand with gravel, silt and clay. Clasts are primarily gray limestone with black hairline fractures and silicified limestone, with lesser greenish gray and reddish brown fine-grained sandstone. Gravel to 3 cm, subrounded to angular. Sand coarse to fine-grained composed of quartz and lithic grains.
65		85	10	5	GP	Mottled, 5YR 6/3	M	Mottled gravel, light reddish brown caliche cement. Abundant pinkish gray sandstone with fewer gray limestone, reddish brown and greenish gray fine-grained quartzite clasts. Clasts are ≤3 cm diameter, subangular to subrounded with caliche coatings.

		GR	**SA**	**Fl**				
70	Basin Fill	tr	65	35	SC	2.5YR6/3	M	Light reddish brown, moderately cemented, clayey to silty sand. Caliche is clayey, swells and disintegrates in water. Sand is coarse to fine lithic grains of gray limestone, reddish brown siltstone, gray phyllite, fine-grained greenish gray sandstone, and white quartz. Damp.
80		15	60	25	SC	5YR 6/3	S	Light reddish brown, calcareous clayey sand with gravel. Gravel clasts to 3 cm are pink, gray and tan; primarily sandstones with lesser silty dark gray limestone. Sand as above. Damp.
90		15	60	25	SC	5YR 5/4	S	Reddish brown, calcareous clayey sand with gravel. Gravel is reddish brown, gray, green fine-grained sandstones, reddish brown siltstone, little phyllite and white quartz, trace gray limestone; mostly ≤1 cm diameter; caliche surface coatings. Sand is fine to coarse-grained lithic grains and quartz.
100		5	65	30	SC	5YR 6/4	S	Light reddish brown clayey sand. Sand is fine to coarse-grained, well-graded through to silt. Sticky and cohesive, swelling when wet.
110		15	65	20	SC	2.5YR 5/3	S	Reddish brown clayey sand with gravel. Gravel is variably colored fine-grained sandstones with lesser siltstone, limestone, chert, phyllite and quartz; clasts are ≤ 1 cm pebbles. Sand is fine to coarse lithic grains and quartz. Clayey calcareous coatings.
120		70	15	15	GC	2.5YR 7/3	S	Light reddish brown clayey gravel with sand. Gravel comprises angular to subrounded ≤ 1 cm pebbles, including green, gray, and reddish brown sandstone, reddish brown siltstone, gray limestone, chert, phyllite, and quartzite; with clayey calcite coatings. Sand is fine to coarse-grained, mostly lithic grains.
130		70	20	10	GP-GC	5YR 7/2	S	Pinkish gray gravel with clay and sand. As above; clayey calcite mixed with fine sand coatings on pebbles.
140		70	20	10	GP-GC	5YR 6/3-6/2	S	Light reddish brown to pinkish gray gravel with clay and sand; little clay. As above.
150		60	30	10	GP-GC	2.5YR 7/3	S	Light reddish brown gravel with clay and sand. Composition as above. Gravel is multicolored when washed; clay imparts overall light reddish brown color.
160		50	40	10	GP-GC	2.5YR 6/2	S	Pale red gravel with clay and sand. As above with about 10% more sand and less gravel.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-13B**
Depth (Ft)	**Graphic Log**	**Estimated % GR**	**SA**	**FI**	**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
170	Basin Fill	65	20	15	GC	2.5YR 6/3	S	Light reddish brown clayey gravel with sand. Gravel clasts are subrounded on weathered surfaces, ≤ 2 cm diameter; lithologic composition as above; continued clayey calcite-fine sand cement coatings on some clasts.
180		15	65	20	SC	2.5YR 6/3	S	Light reddish brown clayey sand with gravel; little silt. Sand is fine to coarse-grained, well-graded, composed mostly of lithic grains with lesser quartz. Gravel composition as above with calcareous coatings on some clasts; most are pebbles ≤ 1 cm.
190		25	65	10	SW-SM	2.5YR 5/3	S	Reddish brown sand with gravel; sand is mostly lithic grains derived from sandstone, siltstone, limestone and Pinal Schist (phyllite and quartz); gravel clasts are of same lithology. Sand is mostly subrounded to subangular; fine to coarse-grained, well-graded through to silt.
200		65	30	5	GP	5YR 7/2	S	Pinkish gray gravel with sand; little silt and clay. Gravel composition is as previous, several intervals since 120'; sand is mostly coarse grained lithic grains. Some clay, fine carbonate, fine sand mix cement coatings on gravel clasts.
210		60	35	5	GP	5YR 7/2-7/3	S	Pinkish gray to pink gravel with sand. Gravel is ≤1.5cm; sand is mostly coarse-grained, compositions as above with the exception of one greenish chloritic intrusive clast.
220		20	60	20	SC	2.5YR 6/3	S	Light reddish brown silty sand with gravel. Sand is mostly lithic grains, fine to coarse-grained. Gravel and lithic sand grains are green, reddish brown, gray fine-grained sandstones and siltstones with a little gray limestone, Pinal Schist (phyllite and metamorphic quartz). Caliche-like (clayey carbonate-fine sand mix) coatings on some clasts.
230		20	60	20	SC	2.5YR 6/3	S	Light reddish brown silty sand with gravel, as above.
238								**First water at 238 ft bls.**
240		35	15	50	CL	5YR 7/3	S	Pink gravelly clay with sand. Clay is sticky, cohesive, plastic. Gravel is subrounded pebbles to angular broken chips developed during drilling. Sand is mostly coarse-grained lithic grains. Gravel and lithic sand grains include sandstone siltstone, chert, limestone, phyllite, and quartz.
250		75	20	5	GP	2.5YR 7/3	S	Light reddish brown gravel with sand. Sand is fine to coarse-grained composed of lithic grains and quartz. Gravel to ≤ 1 cm and lithic sand grains are reddish brown sandstone, reddish and greenish siltstone, gray limestone, reddish gray phyllite, variably colored chert, and white quartz.
260		40	55	5	SW	2.5YR 5/2	S	Weak red sand with gravel. Sand is mostly coarse-grained but ranges from fine to coarse. Gravel clasts are up to 3 cm, coated with calcite and sand. Clast lithologies are as above plus gray arkosic sandstone.

Project Name: **Bisbee Mitigation Order** Boring No.: **BMO-2008-13B**

Depth (Ft)	Graphic Log	Estimated % GR	SA	Fl	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
270	Basin Fill	60	35	5	GP	2.5YR 5/3	M	Reddish brown gravel with sand. Gravel mostly ≤ 1 cm diameter, subrounded to angular freshly broken faces; lithologies as above, few CaCo3 coatings. Sand is fine to coarse, composed mostly of coarse-grained lithic grains.
280		55	40	5	GP	2.5YR 5/2	S	Weak red gravel with sand. Gravel clasts are gray limestone, reddish brown to light gray sandstone, reddish brown siltstone, phyllite, and quartz. Sand-sized particles are mostly lithic grains, many angular, probably generated during drilling. Much of the gravel is angular and freshly broken.
290		65	30	5	GP	2.5YR 5/2	S	Weak red gravel with sand, as above. Gravel composition as above with trace quartzite and green siltstone in addition. Few coarse gravel clasts up to 4 cm in diameter.
300		60	35	5	GP	3.5YR 5/2	M	Weak red polymictic gravel with sand, as above. Gravel is mostly sandstone and siltstone with lesser limestone, phyllite, quartz; with trace rhyolite and Glance Conglomerate clasts. Sand is fine to coarse-grained, mostly lithic grains. Water production is approximately 200 gpm.
310		70	25	5	GP	2.5YR 5/2	M	Weak red gravel with sand. As above; gravel clasts are sandstone, siltstone, limestone, phyllite, quartz, and little rhyolite tuff. Continuing calcite coatings on some clasts.
320		60	35	5	GP	2.5YR 5/2	M	Weak red gravel with sand, as above.
330		75	20	5	GP	2.5YR 5/2	M	Weak red gravel with sand, as above. Gravel clasts include sandstone, arkose, siltstone, gray limestone, phyllite, quartz, and rare tuff; are angular to subrounded; up to 3 cm in diameter; with few white calcite coatings on weathered surfaces.
340		80	20	tr	GP	2.5YR 5/2	M	Weak red gravel with sand; polymictic, clast lithologies as above. Very few fines; sand is mostly coarse lithic grains, well washed by continued high water production.
350		50	45	5	GP	2.5YR 5/2	M	Weak red gravel with sand, polymictic, as above. Calcite coatings on some pebbles.
360		15	85	tr	SW	2.5YR 5/3	M	Reddish brown sand with gravel. Gravel angular to subrounded, to 4 cm, most clasts ≤ 2 cm, composed of sandstone, siltstone, limestone, phyllite, metamorphic quartz (derived from the Pinal Schist), chert, and arkose; calcite-fine sand cement coatings on some pebbles. Sand fine to coarse quartz and lithic grains.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-13B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**Fl**				
370	Basin Fill	45	55	tr	SW	2.5 YR 5/3	M	Reddish brown sand with gravel. Gravel is mostly gray and reddish brown sandstone; arkose, and phyllite with lesser amounts of other lithologies listed above. Sand is mostly medium to coarse, angular to subangular lithic grains.
380		35	65	tr	SW	2.5 YR 5/3	M	Reddish brown sand with gravel. As above. Trace buff-colored limestone with black microfractures.
390		55	45	tr	GP	2.5YR 5/3	M	Reddish brown gravel with sand. Gravel composition as previously described at 360, clasts up to 3 cm diameter but mostly ≤ 1 cm. Sand is fine to coarse lithic grains as above.
400		55	45	tr	GP	2.5YR 5/3	M	Reddish brown gravel with sand. Gravel is angular to subrounded, gray to reddish brown sandstone, arkose, siltstone, quartzite, phyllite, quartz, with only trace amount of limestone, less than previous intervals. Sand is fine to coarse-grained lithic grains and quartz. Fines if present are washed out.
410		75	25	tr	GP	2.5YR 5/2	M	Weak red gravel with sand. Gravel clasts are up to 2 cm, angular to subrounded Pinal Schist (phyllite & metamorphic quartz), gray limestone and chert, gray and reddish brown sandstone, siltstone, and arkose, white quartzite, and trace volcanics. Sand as above. Calcite-fine sand cement coatings on many pebbles.
420		70	25	5	GP	2.5YR 5/2	W	Weak red gravel with sand. Gravel to 2 cm, calcite +/- sand coatings on weathered surfaces; phyllite and metamorphic quartz derived from Pinal Schist clasts are most abundant with lesser amounts of arkosic fine-grained sandstone, medium to coarse-grained vitreous quartzite, little gray limestone and reddish brown siltstone; trace chert and greenish fine-grained sandstone.
430		80	20	TR	GP	2.5YR 5/2	W	Weak red gravel with sand. As above, but coarser with gravel clasts up to 3 cm; composed mostly of sandstone, arkosic sandstone, quartzite, and phyllite clasts, with trace aphanitic volcanics. Continued sandy calcite coatings on weathered pebble surfaces.
440		80	20	tr	GP	2.5YR 5/2	W	Weak red gravel with sand. As above; abundant phyllite, metamorphic quartz, gray and green quartz sandstone, few limestones; calcite-sand cement coatings. Clasts are subangular to subrounded, angular where broken. Sand is fine to coarse-grained, mostly lithic grains and quartz.
450		80	20	tr	GP	2.5YR 5/2 2.5YR 5/1	W	Weak red to reddish gray gravel with sand. Most clasts subangular, almost all are phyllite with little quartz derived from Pinal Schist; calcite-sand cement coatings common on weathered pebble surfaces. HCl reaction limited to cement.
460		80	20	tr	GP	2.5YR 5/2 2.5YR 5/1	W	Weak red to reddish gray gravel with sand, as above. Mostly Pinal Schist (phyllite and quartz) clasts with few sandstone clasts. Calcite-fine sand cement coatings.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-13B**
Depth (Ft)	**Graphic Log**	**Estimated % GR**	**SA**	**FI**	**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
470	Basin Fill	80	20	tr	GP	2.5YR 5/2 2.5YR 5/1 2.5YR 6/3	W	Weak red to reddish gray to light reddish brown gravel with sand, as above. Calcite-fine sand cement coatings.
480		75	25	tr	GP	2.5YR 5/2 2.5YR 5/1 2.5YR 6/3	M	Weak red, reddish gray to light reddish brown gravel with sand. Angular to subrounded ≤ 1 cm Pinal Schist clasts in calcite-reddish brown fine grain sand matrix. Few granular quartzite pebbles. Sand is fine to coarse-grained.
490		80	20	tr	GP	2.5YR 5/2 2.5YR 5/1 2.5YR 5/3	W	Weak red, reddish gray to reddish brown gravel with sand. Composition as above. Most clasts ≤ 1 cm with few oblong, up to 3 cm on long side. Continued calcite-fine sand cement coatings; HCl reaction restricted to cement.
500		75	25	tr	GP	2.5YR 6/3 2.5YR 5/1	W	Weak red to light reddish brown gravel with sand. Pinal Schist phyllite, metamorphic quartz and rare quartzite, subangular to subrounded clasts mostly ≤ 3 cm with some calcite-sand surface coatings. Sand is fine to coarse-grained, reddish brown, composed of quartz and lithic grains.
510		50	45	5	GP	2.5YR 5/2	W	Weak red gravel with sand. Increased sand content. As above, but with a little arkosic sandstone, and quartz sandstone with cement dissolution texture. Pebbles are smaller (mostly ≤ 1 cm, few larger) and more subrounded. 5% material is chunks of lithic sand grains cemented with calcareous reddish brown clay. Few clasts have calcite-sand coatings.
520	Upper Mural Limestone				Bedrock	5 YR 7/2 7.5YR 7/1	S	Pinkish gray limestone with few orange clayey fractures, 90%; basin fill clasts 10%. Few of the limestone chips show rounding with calcite-sand cement indicating a rubbly top of the formation. Limestone has few small shell fragments and few 1 mm spots of recrystallized sparry calcite; otherwise micritic. Few orange calcareous clay balls. Probably Upper Mural Limestone.
526						7.5YR 6/1 7.5YR 7/1		Gray to light gray limestone; few calcite microveinlets, patches of recrystallization, and fine shell fragments. Fractures have orange calcareous clay fillings which pass through cyclone as 15% orange clay balls, turning discharge water orange.
530						7.5YR 6/2	S	Pinkish gray limestone. Reddish orange hematite-limonite and calcareous clay filled microfractures, patches of fine recrystallization; few shell fragments, and discontinuous calcite microfractures. At 530 ft bls, changed from 11 7/8" stratex system to 9 7/8" reverse circulation tricone bit.
535						7.5YR 6/2	S	Pinkish gray limestone, micritic; rare small (1-2 mm) spots of sparry calcite; trace orange clayey limonite very locally in microfractures.
540						7.5YR 6/2	S	Pinkish gray limestone, faintly oolitic; few clear calcite microveinlets and hairline orange hematite microfracture fillings, occasionally with black opaque spotty oxides. Few orange clay balls.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-13B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**FI**				
550	Upper Mural Limestone					7.5YR 7/1	S	Light gray limestone, faint granular texture, some fine oolitic textures locally; 1% intergrown gray chert; weak limonite stain along a few microfractures. Few shell fragments and microfractures at 557'. Orange limonitic clay on fractures at 558'.
560						5YR 6/4	S	Light reddish brown limestone. Broken up, small chips, some stuck together with reddish yellow calcareous clay balls.
570						10YR 7/3	S	Very pale brown mix of limestone as above, clay and few clayey fine-grained sandstone chips. Bottom of limestone; top of claystone-siltstone sequence maybe the boundary between Upper and Lower Mural Limestone. Gougey; maybe faulting or slip along the limestone-clastic rock contact. Clay is mottled
575	Lower Mural Limestone					7.5YR 6/3	S	Light brown fine-grained silty sandstone and clay; clay may be generated from drilling or from pre-existing fracturing. Possibly Lower Mural Limestone.
580						2.5Y 6/4	S	Light yellowish brown soft calcareous clayey siltstone and mudstone; finely broken either by drilling process or tectonic activity.
590						2.5Y 7/3	S	Pale yellow calcareous clay-silt-fine sand mudstone. Broken and clayey as above.
595						2.5Y 6/3	S	Light yellowish brown mudstone (indurated clay, silt, fine-grained sand); combination of fairly hard silty sand layers and soft clay-rich layers; calcareous. Weak limonite stain on fracture surfaces indicates rock fractured prior to drilling.
600						10YR 5/1	S	Gray claystone, with few scattered yellow spots and reddish streaks. Soft and malleable like modeling clay when wet.
604						10YR 7/2	S	Light gray calcareous mudstone (clay, silt, fine-grained sand) with few limonitic microfractures and rare black fine dendrites.
610						10YR 7/2 10YR 6/4	S	Light gray calcareous clayey siltstone chips and light yellowish brown soft clay mix. May represent interbedded siltstone and softer claystone.
620						2.5Y 7/3	M	Pale yellow clayey calcareous siltstone.
630						2.5Y 7/3	M	Pale yellow clayey calcareous siltstone; as above.

Project Name: **Bisbee Mitigation Order**								Boring No.: **BMO-2008-13B**
Depth (Ft)	**Graphic Log**	**Estimated %**			**USCS Symbol**	**Munsell Color**	**HCl Rxn**	**Sample Description**
		GR	**SA**	**Fl**				
640	Lower Mural Limestone					2.5Y 8/2 2.5YR 7/3	M	Pale yellow clayey calcareous siltstone and mudstone. Few small ≤5 mm maroon spots, few small black dendrites on fractures, trace calcite veinlets.
650						10YR 6/1	S	Gray granular sandy limestone. Crystalline limestone with fine oolites; sandy limestone with quartz, red jasperoid, dark opaque, and green fine sand grains; grading to calcareous fine-grained arkose.
660						2.5YR 6/3 5YR 7/2		Light yellowish brown to brown and pale yellow clayey siltstone (80%) and pinkish gray limestone (20%). Limestone has some gray shell fragments and small patches of crystalline calcite. Limonite in microfractures are present locally in the siltstones.
670						10YR 6/1 2.5Y 7/4	M	Gray fine-grained calcareous arkose (50%) and pale yellow calcareous siltstone (50%).
672						10YR 6/1	M	Gray fine-grained calcareous arkose.
679						2.5Y 5/1	S	Gray soft claystone, forms sticky clay when ground by drilling; repeatedly plugged bit and crossover.
680						2.5Y 6/3 5 YR 6/2	S	Light yellowish brown siltstone and claystone, with a small amount of pinkish gray siltstone. Pinkish gray siltstone chips may represent pinkish patches within the more generally yellowish brown strata.
685						2.5Y 6/3 10YR 7/3	S	80% light yellowish brown calcareous siltstone and 20% very pale brown limestone. Limestone has shell fragments and local recrystallized calcite patches. Few pinkish gray siltstone chips also present in sample.
690						2.5Y 7/3	S	Pale yellow calcareous clayey siltstone.
696						2.5Y 7/3	S	Pale yellow calcareous soft, sticky claystone and pale yellow siltstone.
700						2.5Y 7/3 2.5Y 6/2	S	Pale yellow calcareous claystone and light brownish gray siltstone and very fine-grained silty sandstone. The clay/claystone is soft, sticky, and repeatedly plugged up the bit and drill pipe. **TD = 700 ft bls on 8/24/08. Hole caved, bottom 180 ft abandoned.**

10	Basin Fill	60	25	15	GM	7.5YR 8/2	S	Pinkish white silty gravel with sand, well-cemented with hard caliche. Gravel fraction is composed of angular clasts of gray to brownish gray micritic to granular limestone with rare chert. Gravel is in caliche matrix composed of calcium carbonate cemented sand, silt and little clay. Caliche is hard, breaking to angular chunks during drilling. Sand is fine to coarse-grained quartz and lithic grains.
20		5	10	85	CL	5 YR 6/4	S	Light reddish brown calcareous silty clay; well-compacted, passed through cyclone as cohesive chunks.
30		20	45	35	SC	5YR 8/3	S	Pink clayey sand with gravel, moderately well-cemented with caliche. Gravel is ≤2 cm, composed primarily of angular to subangular gray limestone clasts with few white quartzite clasts. Sand is fine to coarse-grained quartz and lithic grains. Caliche matrix varies from hard with crystalline calcite to clayey and friable.
40		50	25	25	GC	5YR 7/4	S	Pink clayey gravel with sand, moderately well-cemented with caliche. Gravel is ≤3 cm diameter, mostly gray micritic limestone with little oolitic limestone, with lesser amounts of reddish brown siltstone, greenish gray fine-grained sandstone, white quartzite and rare milky quartz. Sand as above; caliche as above.
50		15	50	35	SC	5 YR 8/4	S	Pink clayey and silty sand with gravel, moderately well- cemented with caliche. Gravel is subangular to subrounded limestone and clastic pebbles ≤1 cm diameter. Sand is fine to coarse-grained in clayey silty carbonate matrix. Caliche varies from hard crystalline calcite cement to softer friable material with swelling clays.
60		65	20	15	GM	5YR 7/2	S	Pinkish gray silty gravel with sand, moderately to well cemented by crystalline to soft clayey caliche. Gravel is angular to rounded, ≤2 cm diameter, primarily gray limestone, greenish gray fine grained sandstone with small amounts of quartz and siltstone. Sand is fine to coarse-grained quartz and lithic grains.
70		10	50	40	SC	5YR 6/3	S	Light reddish brown clayey sand. Gravel as above; sand is fine to coarse-grained, poorly graded quartz and lithic grains. Clay matrix is calcareous, swelling when wet. Few caliche (calcite, clay, fine sand mix) coatings on gravel.

		GR	**SA**	**FI**				
80	Basin Fill	60	20	20	GC	2.5YR 7/3	S	Light reddish brown clayey gravel with sand. Gravel is primarily gray limestone with some yellow recrystallized limestone with disseminated oxidized pyrite, and few reddish brown siltstone, green siltstone and milky quartz clasts. Fine carbonate-silt sand coatings on some surfaces. Sand is coarse to fine-grained, poorly graded, quartz and lithic grains.
90		35	45	20	SM	2.5YR 7/2 2.5YR 6/2	S	Pale red silty sand with gravel. Gravel is angular to subangular clasts ≤2 cm diameter with a few ≤1 cm rounded pebbles. Gravel clasts are a mix of gray sandstone, greenish yellow and reddish brown siltstone, gray limestone, and trace phyllite and quartz, compositional change relative to previous intervals marked by decreased limestone, increased clastics, appearance of gray sandstone and phyllite. Pink caliche coatings on many faces. Sand is predominately lithic grains, fine to coarse grained, moderately well-graded.
100		85	5	10	GP-GC	5YR 7/3	S	Pink gravel with clay. Pink color is imparted by calcareous clay matrix and of caliche coatings on the gravel clasts. Gravel is light to dark gray, greenish to pale red when washed; composed of gray limestones, gray sandstone, reddish brown siltstone, and fine-grained sandstone with trace phyllite, black chert, and epidote-chlorite-calcite clasts (in order of decreasing abundance).
110		65	20	15	GC	2.5YR 7/3	S	Light reddish brown clayey gravel with sand. Gravel is mostly is ≤2.5 cm, oblong to equidimensional, grading to coarse sand. Clasts are angular to subrounded, with subrounded material being finer pebbles. Sand is coarse to fine-grained. Caliche chunks generated during drilling are 10% of the sample gravel fraction. Gravel composition is as previous interval.
120		65	20	15	GC	2.5YR 7/2	S	Pale red clayey gravel with sand. Gravel clasts are angular to subrounded, ≤4 cm on long side oblong to equidimensional, composed primarily of gray limestone and fine-grained brownish gray sandstone with lesser amounts of chert, and Pinal Schist-derived phyllite and metamorphic quartz. Sand is coarse to fine-grained, with coarser sand mostly lithic grains and fine sand mostly quartz. Soft clayey to hard caliche matrix.
130		60	30	10	GP-GC	2.5YR 7/2	M	Pale red gravel with clay and sand. Pale red color is imparted by color of fines. Gravel and sand are mottled brown gray, green and white with few reds and yellow when washed. Gravel composition has changed relative to above intervals to primarily brown, gray, and green sandstone and siltstones, with some phyllite and little limestone. Gravel is angular to rounded ≤ 1 cm diameter, some with calcite-sand-clay coatings. HCl reaction strong in fine fraction; moderate in sand and gravel.
140		85	10	5	GP	2.5YR 6/3	S	Light reddish brown gravel. Gravel composition is as above but coarser, up to 4 cm on long side; mostly angular to subangular; calcite-sand cement coatings are common.
150		65	25	10	GP-GM	5YR 6/3	S	Pale red gravel with silt and sand. Clasts are ≤ 3 cm, angular to rounded, composed of sandstone, siltstone, phyllite, metamorphic quartz, and limestone. Calcite-fine sand coatings on some surfaces. Sand is coarse to fine-grained, composed of quartz and lithic grains.
160		50	35	15	GM	2.5YR 6/3	S	Light reddish brown silty gravel with sand. As above with larger sand fraction.

170	Basin Fill	70	15	15	GC	2.5YR 7/3	S	Light reddish brown clayey and silty gravel with sand. Clasts are up to 3 cm on long side, but most are ≤1 cm; angular to rounded, composed of gray to brown sandstone, siltstone, limestone, phyllite, and chert; some calcite-sand cement coatings. Sand as above.
180		60	20	20	GC	2.5YR 6.3	S	Light reddish brown clayey and silty gravel with sand. As above with little green siltstone and sandstone clasts in addition.
190		45	35	20	GC	2.5YR 6/3	S	Light reddish brown clayey and silty gravel with sand; clay-calcite-fine sand cement. Gravel clasts are mostly ≤1.5 cm, angular to subrounded; abundant subrounded pebbles, composition as above. Sand is fine to coarse-grained, angular to subrounded, composed of lithic grains and quartz.
200		40	35	25	GC	2.5YR 6/3	S	Light reddish brown clayey gravel with sand, caliche-like cement chunks generated by drilling and as coatings on some gravel clasts. As above but gravel is finer, with most clasts ≤ 1 cm. Sand as above.
210		80	10	15	GC	2.5YR 6/3	S	Light reddish brown clayey gravel. Gravel clasts are subangular to subrounded, equidimensional to oblong, up to 4 cm on long side. Caliche-like cement and coatings on some surfaces. Gravel composition continues to be primarily clastics with lesser limestone, phyllite, quartz, and rare chert. Sand as above.
220		35	45	20	SC	2.5YR 6/3	S	Light reddish brown clayey sand with gravel. Gravel clasts are angular to subrounded, up to 2 cm diameter, but mostly ≤1 cm, grading to coarse sand. Calcite-sand cement coatings. Gravel composition is variably colored sandstone and siltstone, with lesser gray limestone, phyllite and quartz. Sand as above.
230		50	30	20	GC	2.5YR 7/3	S	Light reddish brown clayey gravel with sand. Gravel and sand as above with trace light gray speckled limestone clasts in addition; calcite-sand cement coatings.
240		50	30	20	GC	2.5YR 6/3	S	Light reddish brown clayey gravel with sand. Gravel clasts are up to 3 cm, but mostly ≤1 cm pebbles; angular to subrounded sandstone, siltstones, gray and brown limestone, phyllite, quartz, and fine fossiliferous brown and gray limestone; calcite-fine sand cement coatings. Sand as above.
250		60	30	10	GP-GC	2.5YR 6/2	M	Pale red gravel with clay and sand. Gravel is ≤1 cm in diameter, angular to subrounded; lithologic composition as above. Sand as above.
260		55	40	5	GP	2.5 YR 6/2	M	Pale red gravel with sand. As above.
270		65	30	5	GP	2.5YR 6/2	M	Pale red gravel with sand. Gravel clasts are ≤2 cm diameter, angular to rounded, composed of variably colored sandstones with lesser siltstone, light gray micritic to black crystalline limestone, phyllite and quartz derived from Pinal Schist, and grayish brown chert. Sand as above. Calcite-fine sand cement coatings on some clasts.
280		45	50	5	SP	2.5YR 6/1, 6/2. 6/3	M	Mottled reddish gray, pale red, and light reddish brown sand with gravel. Gravel ≤2 cm, angular to subangular. Sand coarse to fine lithic grains and lesser quartz. Calcite sand cement on gravel clasts.

Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
520	Upper Mural Limestone				bedrock	5YR 7/2	S	Pinkish gray limestone; bedrock. Sample contains about 15% Pinal Schist fine gravel and sand-sized lithic grains, which are likely washing down from above. Limestone has few orangish clay coatings in fractures. Possibly Mural Limestone.
530						7.5YR 7/2	S	Pinkish gray limestone. Fine grained, micritic, locally oolitic; fossiliferous with fine shell fragments. Localized fine breccia textures. Few orange microfractures.
540						7.5YR 7/1	S	Light gray limestone. Limestone is finely crystalline, with few calcite microfracture fillings; fine few mm smooth convex and pectin shell fossil fragments replaced by calcite. Trace very fine-grained oxidized disseminated pyrite. Small amount of sandstone of same color also present; may represent thin sandstone interbed within the limestone.
550						7.5YR 7/1	S	Light gray limestone, finely crystalline, calcite in hairline microfractures, few orange limonite-calcite 1 mm fracture fillings. Rare shell fragments. Trace disseminated partially oxidized disseminated pyrite. Basin fill sand is washing down from the uncased 240-520' zone, and mixing with the bedrock samples.
560						7.5YR 7/1	S	Light gray limestone, as above. Hairline to 1 mm wide orange to yellow limonite +/- calcite fracture fillings. No fossils. Orange microfractures are not as abundant or as clayey as those seen in BMO-2008-13B.
570						7.5YR 7/1	S	Light gray limestone, finely crystalline, no fossils observed. Few hairline fractures with maroon hematite fillings.
580						10YR 7/2	S	Light gray argillaceous limestone, with small shell fossil fragments replaced by clear calcite.
587						10YR 7/2	S	Light gray micritic limestone with some small relic fossil shell textures.
590						10 YR 6/1	S	Gray micritic limestone, with local patches of fine sparry recrystallization. Rare small fossil shell textures.
600						10 YR 6/2	S	Light brownish gray limestone, micritic to finely crystalline, slightly argillaceous; few small shell fragments.
605						7.5YR 7/1	S	Light gray micritic limestone with ≤ 1 mm orange limonite-clay-calcite microveinlets.
607						10YR 6/2	S	Light brownish gray limestone. Rare ≤1 mm fractures filled with orange to white calcite.
610						7.5YR 6/1 10YR 7/3	S	Mixed very pale brown argillaceous limestone with shell fragments and gray micritic limestone with no fossils.
612						7.5YR 5/1	S	Uniform gray micritic limestone, slightly argillaceous, with few small fossil shell fragments replaced by clear calcite.
614						7.5YR 5/1 - 7.5YR 6/2	S	Gray granular textured to light brown micritic limestone, few orange calcite clay fracture fillings up to 2 mm wide.
616						7.5YR 5/1	S	Gray micritic to fine crystalline limestone, slightly argillaceous; few white calcareous clay fracture coatings.
620						7.5YR 6/1	S	Gray fine granular textured limestone with abundant small shell fragments replaced by clear calcite.

Project Name:	Bisbee Mitigation Order					Boring No.: BMO-2008-13M		
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
626						5 Y 5/1	S	Gray clay and little gray claystone. Material is mostly soft sticky plastic clay with few soft claystone chips. Little black disseminated free carbon which floats on top of water once liberated during drilling. This interval may be the top of the Lower Mural Limestone.
630						2.5YR 5/1	S	Gray calcareous mudstone. Mostly silty claystone with some local fine sandy silty claystone (mudstone).
639						2.5YR 5/1	S	Gray calcareous mudstone; mostly silty clay with local very fine sand.
640						2.5Y 6/1	S	Gray muddy limestone with few shell fragments and calcareous gray clay and soft claystone.
646						2.5Y 5/1	S	Gray mudstone. Clayey layers soft; silty sandy, hard gray calcareous mudstone.
650						2.5YR 5/1	S	Gray calcareous mudstone clayey and siltstone with very fine sand; clay balls, soft claystone.
651						GLEY1 5/N	S	As above with less clay and more very fine-grained sand.
657						GLEY1 5/N	S	Gray calcareous mudstone as above.
660						GLEY1 6/1	S	Gray calcareous mudstone; mostly clay and silt, less sandy than above.
670						2.5YR 6/2 to 6/3	S	Light brownish gray to light yellowish brown, strongly calcareous fine-grained sandstone and sandy siltstone, to sandy limestone.
680						10YR 6/1	W	Gray fine-grained arkosic sandstone; slightly argillaceous, calcareous matrix.
684						2.5Y 8/2	M	Pale yellow fine-grained arkosic sandstone and clayey silty fine-grained sandstone/mudstone.
689						10 YR 6/1	M	Gray fine-grained arkosic sandstone. Sand is quartz with few red black and rare green opaques; argillaceous, calcareous matrix.
690						2.5Y 7/1	S	Light gray clayey arkosic fine-grained sandstone. As above with greater clay content. Probably arkosic sandstone as above with thin more argillaceous lamina.
700						2.5 Y 5/1	M	Gray mudstone, from soft claystone to harder silty and fine sandy claystone. Moderately calcareous; carbonaceous.
703						2.5Y 6/2	S	Light brownish gray calcareous clay, claystone, clayey siltstone finely interlaminated.
708						2.5Y 7/2, 2.5Y7/3	S	Light gray to pale yellow limestone with abundant small shell fragments replaced by clear to reddish yellow crystalline calcite.
710						5y6/2	M	Light olive gray calcareous claystone, silty claystone, and clay balls.
712						2.5Y 6/3	M	Light brownish gray argillaceous calcareous fine-grained arkosic sandstone with little siltstone, few small gray shell fragments.
714						2.5Y 8/2	S	Pale yellow mudstone, varying ratios of clay, silt and sand.
720						2.5Y 8/2	S	Pale yellow sandy mudstone. Sand grains are fine-grained, supported in a matrix of clay and silt.
722						10YR 8/2 to 5YR 7/2, 2.5YR 7/2	M	Pale brown to pinkish gray fine-grained quartz sandstone. Sand grains are well sorted, calcite cement. Sandstone bed from 722 - 729 ft bls.

Lower Mural Limestone

Project Name:	Bisbee Mitigation Order					Boring No.: BMO-2008-13M		
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
730	Lower Mural Limestone					2.5Y 8/3	M	Pale yellow mudstone composed of clay, silt, and sand, grading to argillaceous silty sandstone.
731						10R 8/3	M	Pink quartz sandstone, fine to medium-grained, calcareous cement.
735						2.5YR 7/2	M	Pale red quartz sandstone, fine-grained calcite cement.
740						2.5Y 8/1	M	Pale yellow clayey, silty sandstone; fine-grained, calcareous argillaceous matrix.
743						10YR 8/2	W	Very pale brown fine-grained sandstone, argillaceous calcareous matrix.
750						5Y 6/1	W	Gray mudstone, moderately soft when wet, composed of fine sand, silt and clay, and sandy siltstone.
760						2.5Y 5/1	W	Gray mudstone, soft clayey with soft and locally fine sand, carbonaceous. Free fine carbon floats on water in hopper after liberation during the drilling process. Silty layers are more HCl-reactive than clayey material.
770						5Y 5/1	W	Gray mudstone, clay, claystone and clayey siltstone; carbonaceous. Locally carbon can be seen concentrated along fine laminae.
780						GLEY1 5/N	M	Gray calcareous, carbonaceous, silty fine-grained sandstone (80%) and 20% pink fine-grained sandstone (20%).
784.5						GLEY1 5/N	M	Gray calcareous fine-grained sandstone with 1 mm white calcite veinlets. Siltstone bed with carbon flecks that appear to be fine plant fragments at 789.
790						GLEY1 5/N	W	Gray carbonaceous soft claystone.
793						GLEY1 5/N	W	Gray carbonaceous mudstone composed of clay, silt and fine sand.
799						GLEY1 6/N	S	Gray muddy limestone with shell fragments.
800						GLEY1 5/N	M	Gray clayey carbonaceous calcareous siltstone. Visible fine carbon fragments.
810						GLEY1 4/N	M	Dark gray carbonaceous calcareous claystone, moderately soft; sample is mixed claystone chips and clay balls formed during drilling; some silty claystone also present.
820						5 Y 5/1	M	Gray carbonaceous calcareous claystone to fine-grained sandy mudstone. Claystone and clay balls more HCl-reactive than the sandy mudstone.
830						GLEY1 5/N	M	Gray claystone to silty claystone; calcareous, carbonaceous. Few chips of pale yellow limestone.

Project Name:	Bisbee Mitigation Order							Boring No.: BMO-2008-13M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
840	Lower Mural Limestone					GLEY1 5/N	S	Gray calcareous siltstone to mudstone.
841						GLEY1 4/1	S	Gray carbonaceous clayey limestone with shell fragments.
845						GLEY1 4/1	S	Gray argillaceous limestone to calcareous clayey siltstone with scattered shell fragments.
850						GLEY1 5/N	S	Gray carbonaceous calcareous clayey siltstone to claystone.
860						GLEY1 5/N	S	Gray clay and claystone. Clay 80-90% of sample, is very soft, plastic, sticky, cohesive, calcareous. Claystone is soft, slightly platy.
865						GLEY1 5/N	S	Gray clay, claystone, silty claystone, sandy mudstone.
870						GLEY1 5/N	S	As above.
875						GLEY1 5/N	S	As above, clay content has decreased to about 10% of sample. Very small amount of a fine-grained reddish sandstone, calcareous cement.
880						GLEY1 5/N	S	Gray silty claystone, clay, and fine-grained clayey quartz sandstone.
885						GLEY 1 5/N	S	Gray claystone, clay, little siltstone. Claystone soft, platy, calcareous; 30% clay fraction soft, plastic, cohesive, calcareous.
890						GLEY1 5/N	S	Gray calcareous fine-grained sandstone to fine sandy limestone; hard.
895						GLEY1 5/N	S	Gray claystone, clay, and clayey siltstone, mudstone. Claystone soft, slightly platy, calcareous. 15% clay fraction soft, moderately plastic, cohesive.
900						GLEY1 5/N	M	Gray quartz sandstone, fine-grained, calcareous cement, hard; and some fine sandy limestone.
905						GLEY1 6/N	M	Gray fine sandy mudstone, siltstone, claystone, clay, little sandstone; calcareous cementation. 5-10% soft, sticky, moderately plastic clay.
910						GLEY1 6/N	M	Interbedded gray sandstone, sandy siltstone with some clay; small amount of sandy limestone.
915						GLEY1 5/N	M	Gray silty, sandy claystone (mudstone). Sand fraction very fine-grained, fairly hard, calcareous cementation.
920						GLEY1 5/N	M	Gray clay, claystone, silty claystone. Claystone soft, calcareous; 30-40% clay soft moderately plastic, cohesive.
925						GLEY1 5/N	M	As above, 40% fine-grained, hard gray limey sandstone to sandy limestone.
930						GLEY1 5/N	M	Gray clay, claystone, silty claystone and sandstone; sandstone fine-grained with calcareous cement; hard.
935						GLEY1 5/N	S	Gray sandstone. Fine-grained, hard, composed primarily of quartz grains with calcareous cementation.
940						GLEY1 5/N	S	Interbedded gray sandstone, mudstone, calcareous claystone. 10% calcareous clay, very soft, plastic, cohesive.
945						GLEY1 6/N	S	Gray fine-grained calcareous sandstone, siltstone, little limestone and silty limestone. Well-indurated.

Project Name:	Bisbee Mitigation Order							Boring No.: BMO-2008-13M
Depth (Ft)	Graphic Log	Estimated % GR	SA	FI	USCS Symbol	Munsell Color	HCl Rxn	Sample Description
950	Lower Mural Limestone					GLEY1 6/N	S	Gray fine-grained, well-indurated quartz sandstone with calcareous cement and trace carbonaceous material along laminae. 10% soft gray mudstone and 3% pink sandstone.
960						GLEY1 6/N	M	Gray siltstone, claystone, argillaceous limestone, sandstone and little clay. 2-3% soft, moderately plastic, calcareous clay.
970						GLEY1 6/N	S	Gray mudstone and clay. Mudstone soft, calcareous; 25% soft plastic, cohesive, calcareous clay.
980								As above.
985						7.5YR 6/1	M	Gray sandstone, fined-grained, hard, calcareous, mostly quartz grains with few white and black opaque grains.
990						7.5YR 6/1	M	Gray fine-grained quartz sandstone, calcareous cement.
1000						GLEY1 5/N	M	Gray claystone, silty claystone; soft, slightly platy, with calcareous cement; 20% very soft, moderately plastic, cohesive, calcareous clay; trace reddish brown sandstone, .
1005						GLEY1 7/N	M	Light gray arkosic fine-grained sandstone, well-indurated, hard, calcareous cement.
1010						GLEY1 7/N	M	Light gray to gray, fine-grained sandstone with calcareous cement.
						GLEY1 5/N	M	
1015						GLEY1 5/N	M	Gray fine-grained sandstone with calcareous cement; soft siltstone silty claystone with calcareous cement; 15% very soft, moderately plastic, cohesive, calcareous clay.
1020						GLEY1 5/N	M	Gray, moderately soft, sandy clay-rich, calcareous mudstone.
1025						GLEY1 5/N	M	Gray clay, soft, plastic, cohesive, calcareous; silty claystone; trace limestone and pink sandstone.
1030						GLEY1 5/N	M	Gray fine-grained, hard, calcareous sandstone.
1035						2.5YR 7/1	M	Light gray, fine-grained, calcareous sandstone; hard; little dark gray laminated, platy, calcareous claystone.
1040						2.5YR 7/1	M	Light gray, fine-grained, well-indurated, calcareous sandstone and 10%
						GLEY1 4/N	M	dark gray, very soft, plastic, cohesive, calcareous clay.
1045						2.5YR 7/1	M	As above, with slightly less clay.
						GLEY1 4/N		
1050						2.5YR 7/1	M	Interbedded, light gray, hard, fine-grained, calcareous, sandstone; moderately soft, calcareous siltstone and claystone; very soft, moderately plastic, cohesive clay.
1055						2.5YR 7/1	M	As above.

1060	Lower Mural Limestone					2.5YR 7/1	M	Interbedded, light to dark gray, claystone, siltstone, and sandstone, with soft, moderately plastic, cohesive clay.
						GLEY 4/N		
1065						GLEY 4/N	S	Dark gray, soft; plastic, cohesive, sticky, calcareous clay with some mudstone and claystone.
1070						GLEY 4/N	S	Dark gray clay, claystone, and 20% fine-grained, calcareous sandstone.
1075						GLEY 4/N	M	Dark gray, hard, fine-grained, calcareous sandstone.
1080						GLEY 5/N	S	Gray mudstone; with 30% gray well-indurated fine-grained, calcareous sandstone and 20% gray limestone.
1090						GLEY 5/N	S	Gray calcareous, claystone, and limey cherty, with small amount of clay.
1095	Morita Formation					GLEY1 6/N	M	Gray very fine-grained, well-indurated, calcareous sandstone. May be top of Morita Formation
1100						2.5YR5/1	M	Reddish gray to gray calcareous sandstone; probably Morita Formation.

			GR	SA	FI				
0	Basin Fill	---	20	50	30	Mod	10R 4/6	Very silty sand with gravel - Gravel and sand size grains consist of a poorly sorted mix of subrounded to subangular clasts of reddish brown siltstones, light to dark grey limestone, black & white mottled lithic-quartz sandstone, vein quartz, with some chert and green fine grained sandstone. Dark red desert varnish on most clasts, fines fraction consists of a slightly clay red silt. Moderate overall rxn to HCl.	
10		---	20	50	30	Mod	10R 4/6	Very silty sand with gravel-same as above with slightly less red desert varnish on sand and gravel clasts.	
20			50	30	20	Mod	10R 4/6	Gravel with sand - sand size grains and gravel clasts consist of the same lithologies as seen above with purple-black quartzite and very fine grained grey lithic feldspathic-quartz sandstone (or meta-sandstone). Gravels primarily subrounded with gravel size max up to 3cm (mostly ~ 1.5 cm). The fines fraction is a reddish silt, with a moderate overall rxn to HCl.	-Arch to 26 ft bls
30		63	50	30	20	Mod	10R 4/6	Gravel with sand - gravel and sand fraction are the same silt stones, quartzite, limestone and vein quartz as seen above, including some phyllite and an abundance of medium grey siltstone gravel sized clasts up to 2cm, mostly ≤ 1cm.	
40		63	50	30	20	Weak	7.5yr 5/6	Gravel with sand - same as above with orange-red desert varnish coated gravel clasts up to 3.5 cm max, predominately ≤ 1.5cm.	
50	Morita Formation	80				Mod		Pinkish-grey fine to medium grained feldspathic-quartz sandstone with calcareous cement. Easily broken.	-Bedrock contact at 51'
60		80				Mod	5y 5/1	Medium grey siltstone with calcareous cement. Large subangular to angular chips. Rare calcite veinlets. Sample contains ~ 10% grey silty clay. Less abundant pinkish-grey medium grained feldspathic quartz sandstone.	
70		57				Mod	7.5R 4/1	Poorly sorted mix of small (≤ 1 cm) fragments of dark grey to dusty red siltstone and pinkish-grey sandstone. Slickensides present on sandstone chip. Significant (~50%) reddish grey silt present in sample.	-Possible fault
80		57				Mod	7.5yr 6/2	Pinkish-grey to grey feldspathic-quartz sandstone, easily broken, moderate rxn to HCl primarily subangular fragments < 1cm.	
90		71				Mod	7.5yr 3/1 10yr 7/1	Mix of dark grey to dark red siltstone and light colored sandstone, fragments range from sand size to gravel size, up to 2cm.	
100		71				Mod	7.5yr 4/1	Same as above with less abundant grey feldspathic-quartz sandstone. Majority of the sample is dark to medium grey siltstone. Rare light grey argillaceous sandstone and grey calcareous mudstone present.	
110		67				Weak	5r 5/1	Reddish grey sandy siltstone with rare grey feldspathic-quartz sandstone. Siltstone is very friable with a weak rxn to HCl. Calcite veinlets and vein quartz present.	
120		67				Weak Mod	 5y 6/2	Reddish brown silty mudstone with a weak rxn to HCl, very friable. Less abundant greenish-grey silty mudstone with a moderate rxn to HCl, also friable.	
130		92				Slight	5y 5/1	Medium grey siltstone, some calcite veinlets present. Slight overall rxn to HCl.

			GR	SA	FI				
350	Morita Formation	20				None	5R 5/1	Reddish grey to grey siltstone-same as above	
360		30				None	5R 5/1	Same reddish grey siltstone as above with less gravel sized fragments, predominately sand sized, possibly more friable.	
370		63				Slight		Reddish grey siltstone (sand sized fragments) as seen above with larger (up to 3cm) fragments of green-grey mottled feldspathic-quartz sandstone. Siltstone is slightly calcareous, sandstone has a very weak rxn to HCl.	
						Weak	5R 5/1		
380		63				None	5R 5/1	Reddish grey sandy siltstone, very friable, no rxn to HCl.	
390		31				None	5R 5/1	Reddish grey and rare light grey sandy siltstone. Rare calcite vugs and veinlets, otherwise to rxn to HCl. Less friable than above.	
							7.5yr 5/1		
400		31				Weak-none	5R 5/1	Reddish grey sandy siltstone-sand grains in the siltstone are fine grained, sample is a mixture of platy and blocky chips, rare calcite coatings on some chip faces, otherwise no rxn to HCl.	
410		36				Weak	5R 5/1	Reddish grey to grey sandy siltstone, majority of the sample is sand sized chips. Siltstone fragments have some white bleached spots and rare calcite vugs.	
							7.5yr 5/1		
420		36				Weak	5R 5/1	Reddish grey to grey sandy siltstone, same as above.	
							7.5yr 5/1		
430		34				Weak	5R 5/1	Reddish grey sandy siltstone, sample is homogeneous, large blocky, very friable chips.	
440		34				Weak	5R 5/1	Reddish grey sandy siltstone, majority of the sample is sand sized chips calcite castings on some fragments and vein quartz present.	
450		43				Weak	5R 5/1	Reddish grey sandy siltstone, large friable fragments with rare calcite coatings on some faces of siltstone chips.	
460		43				Weak	5R 5/1	Reddish grey sandy siltstone, large friable fragments with rare calcite coatings on some faces of siltstone chips.	
470		23				Weak	5R 5/1	Reddish grey sandy siltstone as above with smaller sand sized chips as the majority of the sample. Note: Tacna in sample from zonal sampling/temp. wells.	
480		23				None	5R 5/1	Reddish grey sandy siltstone, large blocky fragments with white bleach spots and black spots on several chips.	
490		32				Weak	5R 5/1	Reddish grey sandy siltstone as above with majority of the sample is sand sized chips.	
500		32				Weak	5R 5/1	Reddish grey sandy siltstone-same as above, sample is very friable sand sized chips with rare vein quartz.	
510	Mortita Formation	32				None	5R 5/1	Reddish grey to grey sandy siltstone. Larger, mostly blocky chips. Homogeneous, no rxn to HCl.	
520		30				Weak	5R 5/1	Same sandy siltstone as seen above with large calcite crystals (veinlets) on some fragments.	
530		32				Mod	5R 5/1	Reddish grey to grey sandy siltstone and less abundant pinkish-grey fine grained argillaceous sandstone. Moderate rxn to HCl on both.	
							7.5yr 4/1		
540		32				Weak	7.5yr 4/1	Grey sandy siltstone, slightly calcareous.	
550		32					7.5yr 4/1	Same grey sandy siltstone as above with minor slickensides on lager chips.	-TD @ 560'

Project Name: Greenbush Draw Wells

Boring Name: BMO-2010-3B

Depth	Graphic Log	Drill Rate (feet/hr)	Estimated %			HCl Rxn	Munsell Color		Remarks
			GR	SA	FI				
150	Basin Fill	48	50	30	20	Slight	5yr 5/4	Gravel with sand - same as above with more abundant dark brown to purple rounded mudstone fragments.	
160		36	50	30	20	Slight	5yr 5/4	Gravel with sand - same as above with more abundant gravel clasts over 1cm, up to 2.5cm. Sample includes angular fragments of grey limestone, possibly cobbles broken by drilling action.	
170		36	50	30	20	Weak	5yr 5/4	Gravel with sand - Gravel and sand size grains consist of a poorly sorted (well graded) mix of subangular to rounded clasts of green to orange fine grained lithic-quartz sandstone, dark grey limestone, and vein quartz. Gravel size is up to 3cm, predominately ~1-1.5cm. The fines fraction consists of reddish brown clayey silt with a weak overall rxn to HCl.	
180		44	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above with gravel size predominately ≤1cm.	
190		44	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above	
200		25.5	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above	
210		25.5	60	20	20	Mod	5yr 5/4	Gravel with sand - Gravel and sand size grains have same lithologies as above: fine to medium grained lithic-feldspathic-quartz sandstone, medium to coarse grained lithic sandstone, grey limestone, phyllite, quartzite, dark mudstones, and vein quartz. Gravel size ≥1cm, up to 3cm. Gravel clasts are subangular to angular (possibly cobbles broken by drilling action). The fines fraction continues to be a reddish brown clayey silt with an overall moderate rxn to HCl.	
220		36	50	30	20	Mod	5yr 5/4	Gravel with sand - same as above with gravel size predominately ≤1cm. Less abundance of angular fragments, mostly subangular to subrounded.	
230		36	50	30	20	Mod	5yr 5/4	Gravel with sand - same as above with rare white tuff.	
240		20	50	30	20	Weak	5yr 5/4	Gravel with sand - same sandstones, mudstones, phyllite, quartzite, limestone, and vein quartz as seen above. Gravel size ranges between 4mm-2.5cm, predominately subangular clasts ≤1cm. Both gravel and sand are very poorly sorted subrounded to subangular fragments. Reddish brown fines fraction consists of slightly clayey silt with a weak rxn to HCl.	
250		20	50	30	20	Weak	5yr5/4	Gravel with sand - same as above	
260		23.5	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above	
270		23.5	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above with more abundant smaller gravels (~.5cm).	
280	Basin Fill	29	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above with white sandy limestone gravel and sand sized grains present.	
290		29	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above	
300		33	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above	
310		33	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above	
320		27	50	30	20	Weak	5yr 5/4	Gravel with sand - same as above

Depth	Graphic Log	Drill Rate (feet/hr)	Estimated %			HCl Rxn	Munsell Color	Sample Description	Remarks
			GR	SA	FI				
0-15	Basin Fill	n/a	10	45	45	Mod	5yr 5/4	Reddish brown sandy silt with gravel. Gravel clasts range in size up to 1.5cm, primarily <1cm. Gravel and sand fraction are polylithic with subrounded to subangular clasts of very fine to medium grained sandstone, purple quartzite, and grayish brown siltstones. Sand fraction consists of poorly sorted very fine to very coarse sand, primarily very fine silica sand. Loose dry mix with a moderate reaction to HCl.	-Surface Casing borehole is 14 3/4" from 0-15' bls
20		20	30	40	30	Weak	5yr 5/4	Silty sand with gravel - Gravel fraction is poorly sorted and polylithic with subangular to subrounded clasts of very fine to medium grained sandstones, purple quartzite, grey siltstones and a lesser abundance of grey limestone and phyllite. Sand fraction is predominately coarse subangular clasts with same composition as gravel fraction. Slightly clayey silt makes up the reddish brown fines fraction. Weak overall reaction to HCl.	
30		20	50	30	20	Weak	5yr 5/4	Sandy gravel - Gravel fraction consists of poorly sorted, subangular to subrounded clasts of very fine to very coarse grained sandstones, grey chert, white to dark grey quartzite, and a rare occurrence of limestone. Gravel size ranges up to 2.5cm, mostly ~1cm. sand fraction is primarily coarse with the same composition as gravel fraction. Reddish brown fines fraction consists of slightly clayey silt with an overall weak reaction to HCl.	
40		20	50	20	30	Weak	5yr 5/4	Silty gravel with sand - same as above with more clayey silt and smaller gravels up to 1.5cm, mostly <1cm.	
50		20	50	30	20	Slight	5yr 5/4	Sandy gravel - Gravel fraction consists of subangular clasts up to 1.5cm. Gravel is poorly sorted, polylithic with medium grey limestone, phyllite, quartzite, white very fine grained sandstone with calcareous cement, and purple siltstone. Sand fraction is poorly sorted, subangular lithic grains. Fines fraction consists of very clayey silt, reddish brown. Slight reaction to HCl.	
60		20	50	30	20	Slight	5yr 5/4	Sandy gravel - same as above	
70		20	50	30	20	Slight	5yr 5/4	Sandy gravel - same as above	
80		20	60	20	20	Slight	5yr 5/4	Gravel with sand and silt - Gravel fraction consists of subangular to subrounded clasts up to 4cm of pinkish grey limestone, very fine grained sandstone and siltstone, phyllite, and quartzite. Sand fraction consists of subangular, poorly sorted lithic grains. Fines fraction is reddish brown, very clayey silt that readily forms a ball. Slight overall reaction to HCl.	
90	Basin Fill	20	50	30	20	Slight	5yr 5/4	Sandy gravel - Gravel and sand sized grains are subangular to angular and poorly sorted. Gravels are dark to light grey limestone with some white to pink silicates, less abundant purple to white fine grained sand/siltstones. Size of gravel clasts range up to 2.5cm, mostly <2cm. Sand is coarse lithic grains. Fines fraction is reddish brown silt with a lesser amount of clay than seen above. Slight overall reaction to HCl.	
100		20	30	30	40	Weak	5yr 5/4	Very clayey silt with sand and gravel - Gravel consists of subangular fragments of grayish quartzite, phyllite, calcareous sandstone, light to medium grey limestone, and purple siltstone. Sand fraction is subangular lithic grains, also with subrounded quartz and rare altered volcanics. Fines fraction is a reddish brown clayey silt.	
110		20	30	30	40	Weak	5yr 5/4	Very clayey silt with sand and gravel - same as above	
120		20	30	30	40	Weak	5yr 5/4	Very clayey silt with sand and gravel - same as above	

CLEAR CREEK ASSOCIATES

GEOLOGIC LOG

Project No.: 055038

Project Name: CQB Focused Bedrock Investigation **Boring Name: BMO-2010-3M**

Depth	Graphic Log	Drill Rate (feet/hr)	Estimated %			HCl Rxn	Munsell Color	Sample Description	Remarks
			GR	SA	FI				
130	Basin Fill	20	30	30	40	Weak	5yr 5/4	Very clayey silt with sand and gravel - same as above	
140		20	50	30	20	Weak	5yr 5/4	Sandy gravel - Gravel and sand sized grains consist of subangular to subrounded, poorly sorted fragments of feldspathic-quartz sandstones, greenish grey limestone, purple siltstone, and white to green chert. Gravel size is generally smaller than previous depths, size range is up to 1.5cm, mostly <1cm. Sand fraction is primarily coarse lithic grains. Fines fraction contains slightly clayey silt with an overall weak reaction to HCl.	
150		20	50	30	20	Weak	5yr 5/4	Sandy gravel - same as above	
160		20	50	30	20	Weak	5yr 5/4	Sandy gravel - same as above with slightly higher clay content in fines fraction.	
170		20	50	30	20	Weak	5yr 5/4	Sandy gravel - Gravels and sand sized grains consist of subangular, poorly sorted clasts of feldspathic-quartz sandstone, medium to fine grained sandstone with calcareous cement, purple-brown siltstone, grey quartzite, light grey to brown limestone with a lesser abundance of phyllite and pink to orange silicates. Gravel diameter up to 2cm max, mostly ~1cm. Fines fraction consists of reddish brown clayey silt.	
180		20	50	30	20	Weak	5yr 5/4	Sandy gravel - Same as above	
190		20	50	30	20	Weak	5yr 5/4	Sandy gravel - Same as above	
200		20	50	30	20	Weak	5yr 5/4	Sandy gravel - Gravel fraction is angular to subangular, up to 2cm, mostly ~1cm, and includes pink to green to light grey limestone, dark grey siltstone, white calcareous sandstone, pink feldspathic-quartz sandstone, white opaque quartz, phyllite, and almost black quartzite. Sand fraction in coarse, subrounded lithic grains. Reddish brown silt with clay comprises the fines fraction.	
210		20	50	30	20	Weak	5yr 5/4	Sandy gravel - same as above with generally smaller gravels up to 1.5cm, predominately 5-8mm. Fines fraction contains less clay than seen above.	
220		6	50	30	20	Weak	5yr 5/4	Sandy gravel - same as above	
230		20	50	30	20	Weak	5yr 5/4	Sandy gravel - same as above	
240	Basin Fill	20	40	40	20	Weak	5yr 5/4	Coarse sand and gravel - Sand and gravel fraction consists of the same lithologies as above (200'-230'). Gravel size is much smaller in this unit, up to 1cm max, generally ≤6mm. Sand and gravel are angular to subangular and moderately sorted. Fines fraction is reddish brown silt with little to no clay.	
250		20	50	30	20	Weak	5yr 5/4	Sandy gravel - lithologies are the same as above. Gravel size has increased to a max of 2.5cm, mostly ~1cm.	
260		20	60	20	20	Weak	5yr 5/4	Gravel with sand and silt - gravel size up to 2cm, mostly ~1cm. Clasts are light grey to pink limestone, white to reddish quartzite, dark coarse grained sandstone, reddish siltstone, and rare quartz and phyllite. Some sand and gravel clasts have a calcite coating. Sand is predominately coarse angular grains with the same lithologies as gravel fraction. Fines are reddish brown silt with little to no clay.	
270		20	60	20	20	Weak	5yr 5/4	Gravel with sand and silt - same as above	
280		20	60	20	20	Weak	5yr 5/4	Gravel with sand and silt - same as above with predominately <1cm gravels. Minor clay in the fines fraction.	
290		20	60	20	20	Weak	5yr 5/4	Gravel with sand and silt - same as above with medium grained calcareous white sandstone.	

CLEAR CREEK ASSOCIATES

GEOLOGIC LOG

Project No.: 055038

Project Name: CQB Focused Bedrock Investigation **Boring Name: BMO-2010-3M**

Depth	Graphic Log	Drill Rate (feet/hr)	Estimated %			HCl Rxn	Munsell Color	Sample Description	Remarks
			GR	SA	FI				
300	Basin Fill	20	60	20	20	Weak	5yr 5/4	Gravel with sand and clayey silt - gravel lithologies are the same as seen above: white to purple to black quartzite, light grey to greenish grey limestone, white medium grained calcareous sandstone, medium grained reddish lithic-feldspathic-quartz sandstone. Some calcite coatings on gravel clasts. Gravel diameters up to 1.5cm, predominately <1cm, angular to subangular. Sand is mostly coarse and subangular with the same lithologies as gravel fraction with a mix of clear and opaque white to reddish quartz grains in sand fraction. Fines are a reddish brown silt with sticky clay.	
310		20	60	20	20	Weak	5yr 5/4	Gravel with sand and silt - same as above with less clay in fines fraction	
320		20	60	20	20	Weak	5yr 5/4	Gravel with sand and silt - same as above	
330		20	60	20	20	Mod	5yr 5/4	Gravel with sand and silt - same as above	
340		20	30	50	20	Mod	5yr 5/3	Sand with gravel - Sand sized grains ands gravels have same lithologies as seen above units with an abundance of white fine grained calcareous sandstone. Grains are subangular and predominately coarse. Fines fraction consists of a reddish brown clayey silt.	
350		14	50	30	20	Mod	5yr 5/3	Sandy gravel - Sand sized grains and gravel clasts are he same sandstones, limestones, siltstones, and meta-seds seen above with subrounded to subangular poorly sorted fragments. Gravel size up to 1.5cm, mostly <1cm. Fines are a reddish brown clayey silt. Overall reaction to HCl is moderate. Some gravel clasts have calcareous coatings.	
360		14	40	10	50	Mod	7/1 10gy	Calcareous clayey silt with gravel - Clayey silt is greenish grey with a moderate reaction to HCl, readily forms a ball. Gravels are grey to greenish grey limestone, white fine grained calcareous sandstone, reddish medium grained sandstone, reddish purple siltstone, opaque white to reddish quartzite, and phyllite. Sand grains are subangular coarse grains with the same lithologies as gravel.	
370		7	40	10	50	Mod	7/1 10gy	Calcareous clayey silt with gravel - same as above, clayey silt is more sticky	
380		7	30	10	60	Mod	5G 5/2	Very sticky calcareous silty clay - Clay is grey. Gravels are greenish grey fine grained sandstone and grey calcareous siltstone with pink and black crystalline clasts. Crystalline calcite coatings on some sandstone fragments. Rare dark purple meta-seds present.	
	Cintura Formation								-Bedrock contact ~386'
390		7				Strong	7.5yr 5/2	Sticky brownish grey silty clay with dark grey limestone, reddish to green fine grained sandstone. Some rare calcite coated meta-seds. Sand sized grains are subrounded with same lithologies as larger gravel sized pieces. Gravel sized clasts up to 1.5cm, subangular to subrounded.	
400		7				Mod	7.5yr 5/2	Pink grey fine grained lithic-feldspathic-quartz sandstone with calcareous cement, green fine grained lithic-quartz sandstone with calcareous cement. ~30% silty clay in sample	
410		7				Mod	7.5yr 6/1	Green-grey fine grained lithic-quartz sandstone with calcareous cement, brown mottled fine grained lithic-feldspathic-quartz sandstone, both easily broken. ~50% of sample is grey silty clay	
420		7				Mod	5yr 6/1	Pink-grey fine grained lithic-feldspathic-quartz sandstone with calcareous cement is most abundant in sample, Also, green-grey claystone and dark brown siltstone present. Rare white-pink vein quartz and green fine grained lithic-quartz sandstone. Rare micaceous brown-grey lithic sandstone. ~30% grey/brown soft sticky clay present in sample.	
430		7				Mod	6/10gy	Same lithic fine grained sandstones as above with significant increase in green-grey claysotne and dark brown siltstone. ~40% of sample is soft, sticky grey-green clay	

CLEAR CREEK ASSOCIATES

GEOLOGIC LOG

Project No.: 055038

Project Name: CQB Focused Bedrock Investigation **Boring Name: BMO-2010-3M**

Depth	Graphic Log	Drill Rate (feet/hr)	Estimated %			HCl Rxn	Munsell Color	Sample Description	Remarks
			GR	SA	FI				
440	Cintura Formation	7				Strong	5yr 6/1	Pale green fine grained argillaceous sandstone, strong reaction to HCl, easily crumbled pink-grey fine grained lithic-feldspathic-quartz sandstone with calcareous cement and green fine grained lithic-quartz sandstone. Less abundant claystone and siltstone.	
450		2				Slight	7.5yr 6/1 5yr 6/1	Mix of pale green argillaceous fine grained sandstone with calcareous cement, pink-grey fine grained lithic-feldspathic-quartz sandstone, brown to grey-green mudstone, and rare vein quartz. Minor limonite staining on some fragments.	
460		2					5yr 6/1	Pink-grey fine grained lithic-feldspathic-quartz sandstone with calcareous cement. Less abundant mudstones and brown fine grained sandstone with calcareous cement.	
470		2					5yr 6/1	As above with more sand sized grains of pink-grey fine grained sandstone than seen above. Same grey-green to brown mudstone and minor limonite stained quartz sandstone with calcareous cement present.	
480		2					5yr 6/1	Pink-grey fine grained lithic-feldspathic-quartz sandstone with calcareous cement. Less abundant mudstones and brown fine grained sandstone with calcareous cement - same as above	
490		2					5yr 6/1	Pink-grey fine grained lithic-feldspathic-quartz sandstone with calcareous cement. Less abundant mudstones and brown fine grained sandstone with calcareous cement - same as above	
500		2					7.5yr 6/8	Transition to bright orange very clayey silt (comprises ~40% of sample). Abundant pink-orange medium grained lithic-feldspathic-quartz sandstone with weak calcareous cement, and dark brown to green mudstone. Less abundant grey-brown fine grained lithic-quartz sandstone.	
510		2					7.5yr 6/8	Bright orange very clayey silt with sandstone and mudstone - same as above	
520		2					7.5yr 5/2	Transition to grey-brown clayey silt (very little orange fines now), less abundance of pink-orange sandstone, more abundant white-grey fine grained lithic-quartz sandstone and mudstones as seen above. Greenish white medium to coarse grained lithic-quartz sandstone.	
530		4					7.5yr 5/2	Grey-brown clayey silt with white-grey fine grained lithic-quartz sandstone and mudstone - same as above

340-360 [2]	---	---	---	---	---	---
370-390	8.44	25.9	640	330	72	84
460-480	8.07	25.3	990	520	168	190

Notes:

ft bls = feet below land surface

SU = Standard units

µS/cm = microsiemens per centimeter

^{o}C = Degrees Celsius

ppm = parts per million

mg/L = milligrams per liter

- - = not measured

Field sulfate measurements conducted with an HACH DR 890 Colorimeter

[1] Reconnaissance groundwater sample results are not considered to be representative of formation water. Drilling conditions required that foam and water be injected into the borehole while drilling. The sample results are similar to a field sulfate test of the construction water in which a sample was taken from the water truck (29 mg/L).

[2] The temporary well set at 340'-360' (Zone 3) was not sampled due to an ineffective bentonite seal.

TABLE K.15
BMO-2010-2M Reconnaissance Water Sampling Results

Sample Depth ft bls	pH SU	Temperature °C	EC µS/cm	TDS ppm	Field Sulfate mg/L	Laboratory Sulfate mg/L
Reconnaissance Groundwater Samples

APPENDIX M

WELL CONSTRUCTION SUMMARIES FOR BMO-2008 AND BMO-2010 WELLS

HYDRO GEO CHEM, INC.

Well Construction Summary

Project Name:	**Bisbee Mitigation Order**			Boring No.:	**BMO-2008-1G**
Drilling Co.:	WDC Exploration and Wells			Project No.:	872000
ADWR Well No.:	**55-909474**	Driller:	William Berg	Geologist	Kim Wilson
UTM Location:	3467919.582 N	602012.923 E	Elevation:	4583.97 ft	NAD83/NAVD88

DRILLING SUMMARY

Total Depth:	320 ft bls	Hole Diameter:	12" to 230', 8.5" to 320'
Drill Rig:	GEFCO Speedstar 50K-CH	Drill bit/Type:	Stratex to 230', Tricone to 320'

WELL CONSTRUCTION DATA

Type of Material	Depth Interval (ft bls)		Description
	From	To	
Casing	0	180	5" steel, ASTM A53-B
Well Screen	180	300	5" steel, 0.125" slots
Sump	300	310	5" steel, ASTM A53-B
Centralizer Locations	150	300	4 @ 50' ft intervals along screen
Cement Grout	0	20	Type II Portland Cement
Bentonite Grout	20	147	High-solids bentonite grout
Bentonite Pellets	147	160	Coated time release pellets
FineTransition Sand	160	165	No. 60 Sand
CoarseTransition Sand	165	170	8x12 Sand
Filter Pack	170	320	#8 Tacna

CONSTRUCTION TIME LOG

TASK	Start		Finish	
	Date	Time	Date	Time
Drilling	29-Jul-08	10:08	31-Jul-08	12:59
Casing	5-Aug-08	15:40	6-Aug-08	13:35
Filter Pack	6-Aug-08	14:22	8-Aug-08	9:42
Bentonite Pellets	8-Aug-08	9:44	8-Aug-08	10:23
Bentonite Grout	8-Aug-08	10:45	8-Aug-08	15:15
Cement	9-Aug-08	10:30	9-Aug-08	10:45

AIRLIFT WELL DEVELOPMENT

Date & Time Started:	9-Aug-08 7:25	Flow Rate in gallons per minute:	8
Date & Time Completed:	9-Aug-08 9:25	Static water level in feet bls:	61
Duration in minutes:	120	Gallons Purged:	970

Remarks:

from HGC (2009c)

HYDRO GEO CHEM, INC.

Well Construction Summary

Project Name:	**Bisbee Mitigation Order**			Boring No.:	**BMO-2008-3B**
Drilling Co.:	WDC Exploration and Wells			Project No.:	872000
ADWR Well No.:	**55-909147**	Driller:	Arnold Lamon	Geologist:	Warren Thompson
UTM Location:	3472626.482 N	606800.995 E	Elevation:	4844.67 ft	NAD83/NAVD88

DRILLING SUMMARY

Total Depth:	590 ft bls	Hole Diameter:	12" to 165', 10" to 195', 8.5" to 590'
Drill Rig:	GEFCO Speedstar 50K-CH	Drill bit/Type:	Stratex to 165', ARCH to 195', Tricone to 590'

WELL CONSTRUCTION DATA

Type of Material	Depth Interval (ft bls)		Description
	From	To	
Casing	0	150	5" steel, ASTM A53-B
Well Screen	150	250	5" steel, 0.125" slots
Sump	250	260	5" steel, ASTM A53-B
Centralizer Locations	150	250	3 @ 50' ft intervals along screen
Cement Grout	0	20	Type II Portland Cement
Bentonite Grout	20	120	High-solids bentonite grout
Bentonite Chips	120	130	Medium chips
FineTransition Sand	130	135	No. 60 Sand
CoarseTransition Sand	135	140	8x12 Sand
Filter Pack	140	272	#8 Tacna
Bentonite Chips	272	590	Borehole abandonment

Bentonite Chips - lower seal	11-Sep-08	11:35	11-Sep-08	14:45

AIRLIFT WELL DEVELOPMENT

Date & Time Started:	9/16/2008 15:25	Flow Rate in gallons per minute:	80
Date & Time Completed:	9/16/2008 17:35	Static water level in feet bls:	206.95
Duration in minutes:	130	Gallons Purged:	10,400

Remarks: Borehole caving prevented further penetration. Bottom of borehole was abandoned to complete well in the basin fill aquifer.

Well Construction Summary

Project Name:	**Bisbee Mitigation Order**			Boring No.:	**BMO-2008-13M**
Drilling Co.:	WDC Exploration and Wells			Project No.:	872000
ADWR Well No.:	**55-909760**	Driller:	William Berg	Geologist:	Warren Thompson
UTM Location:	3470040.455 N	601650.495 E	Elevation:	4647.15 ft	NAD83/NAVD88

DRILLING SUMMARY

Total Depth:	1100 ft bls	Hole Diameter:	12" to 240', 10" to 1100'
Drill Rig:	GEFCO Speedstar 50K-CH	Drill bit/Type:	Stratex to 240', Tricone to 1100'

WELL CONSTRUCTION DATA

Type of Material	Depth Interval (ft bls)		Description
	From	To	
Casing	0	920	5" steel, ASTM A53-B
Well Screen	920	1020	5" steel, 0.125" slots
Sump	1020	1030	5" steel, ASTM A53-B
Centralizer Locations	920	1020	3 @ 50' ft intervals along screen
Cement Grout	0	20	Type II Portland Cement
Bentonite Grout	20	878	High-solids bentonite grout
Bentonite Pellets	878	898	Coated time release pellets
FineTransition Sand	898	903	No. 60 Sand
CoarseTransition Sand	903	908	8x12 Sand
Filter Pack	908	1039	#8 Tacna
Bentonite Chips	1039	1100	Lower seal

N.59 Measured and Simulated Drawdowns at NWC-3 during Pumping of TVI-875 at Approximately 380 GPM (Using Neuman Solution in AQTESOLV)

1. HYDRAULIC TESTING

This section describes the performance, analysis, and results of hydraulic tests conducted at the BMO-2008-Series (BMO-Series) groundwater monitoring wells and well nests installed under Task 2.3, and the selected pre-existing wells under Task 2.4 of the Work Plan (HGC, 2008). Locations of the tested wells are shown in Figures 8 and 10 and construction details are summarized in Table 13 of the main text. A detailed description of each well is provided in the well installation section of the report (Section 3.4 of the main text). Geologic logs for the BMO-2008-Series wells are in Appendix J of the main text.

The purpose of hydraulic testing was to evaluate aquifer hydraulic properties, including transmissivity, storage coefficient, and where possible, vertical hydraulic conductivity in the vicinity of each well. Hydraulic testing was conducted using the procedures described in the Work Plan. Most tests were conducted at multiple pumping rates (thereby constituting step rate tests), to enable evaluation of pumping well efficiency parameters. Pumping well efficiency parameters quantify the proportion of drawdown in the pumped well that is due to resistance to flow into the well bore and include non-linear head losses related to flow through well screen slots. In some cases, especially where the permeability of the aquifer is relatively high, the drawdown in the well is dominated by these head losses. This effect is illustrated in Figure N.1.

Hydraulic testing was conducted at each BMO-2008 well installed for Task 2.3 as described in the Work Plan (HGC, 2008). During hydraulic testing of the BMO-2008 wells, a water sample from each well was collected and analyzed for sulfate and a suite of major

elements as an initial characterization of water quality. The results of the initial sampling of the BMO-2008 wells are included in Table 11 of the main text.

1.1 Selection of Existing Wells

Hydraulic testing of wells existing prior to the installation of the BMO-Series well for Task 2.4 was conducted to develop additional hydraulic properties data for aquifer characterization. Testing at the existing wells required identifying appropriate and accessible wells. Wells identified by the well inventory (Section 3.1 of the main text) were screened to eliminate previously tested wells, dry wells, and wells that were inappropriate due to obstructions, a lack of access ports, or lack of a permanent cap. Additionally, wells were eliminated from testing if they were screened across more than a single geologic formation or if the geologic formation of the screened interval was unknown. Although there were a large number of potential wells considered, hydraulic testing was not practical at the majority of them because of difficulty obtaining access, the inability to interrupt water supply pumping, or construction characteristics that made the well poorly suited to hydraulic testing.

Five existing wells were selected for hydraulic testing: COB MW-1 (hereafter referred to as MW-1), GARNER 635, TM-02A, NWC-03, and TVI-875. MW-1 was chosen because it is a basin fill well near the location of BMO-2008-7M. GARNER 635 and TM-02A were chosen to test the Cintura and Morita Formations near the leading edge and source area of the sulfate plume, respectively. NWC-03 and TVI-875 were selected because they are in basin fill at the leading edge of the sulfate plume and have nearby wells that were used as observation wells.

1.2 Hydraulic Test Procedures

Hydraulic tests at the BMO-2008-series wells and the selected existing wells consisted of step-rate pumping of the well, measuring the pumping rates, and measuring the water levels in the pumping well and nearby observation wells (where available) before, during, and after pumping. Constant-rate pumping was performed when step-rate pumping was not practical. Observation wells consisted of other newly installed co-located wells, or existing nearby wells, that were screened at intervals deeper or shallower than the pumped well, often within a different hydrologic unit than the pumped well. For example, one well may have been completed in the basin fill and the other in the underlying bedrock at a particular location. Barometric pressure was also measured during each test to allow correction for any barometrically induced water level changes. Collected data were analyzed to estimate pumped well efficiency parameters and aquifer hydraulic properties in the vicinities of the well nests. Hereafter, for convenience, wells will be referred to using a shortened designation, for example BMO-6B, rather than BMO-2008-6B.

1.3 Pumping Procedures

Hydraulic tests were conducted subsequent to development of each new well. A sufficient time was allowed between well development and testing to allow recovery after development. Submersible pumps for testing BMO-series wells were supplied, deployed, and operated by Verdad Group, LLC. Testing at existing wells was conducted using the dedicated submersible pumps in the wells. Each well (except MW-1, TM-02A, GARNER 635, NWC-03, and TVI-875) was pumped at multiple, increasing, rates to allow analysis of pumping well

efficiency parameters. Target pumping rates were approximately 15, 30, and 50 gallons per minute (gpm) for basin fill wells and 5, 10, and 20 gpm for bedrock wells. Actual pumping rates varied depending on pump capacities, well productivities, and aquifer properties. For example, most wells completed in the Glance Conglomerate were pumped at substantially lower rates due the formation's low productivity. At BMO-1G and BMO-10GU, the tested well was pumped at only two rates due to low productivity. In general, the duration of pumping at the first two rates was approximately 1 hour for each, and at the maximum rate, approximately 8 hours (hrs), although at some locations (e.g., BMO-10GL) the initial low rate was sustained for approximately 8 hrs and the higher rates at about 1 hr each. Table N.1 lists pumping rates and durations for each test.

Pumping rates for BMO-series tests were measured using in-line flowmeters supplied by Verdad Group and by measuring the time to fill a vessel of known volume (the "bucket and stopwatch" method). In most cases, the vessel consisted of a calibrated, 55-gallon drum that allowed very accurate calculation of actual pumping rates because of its large capacity. Pumping rates for tests at existing wells were measured using in-line flowmeters when possible or by the bucket and stopwatch method.

1.4 Water Level Monitoring

Water level monitoring consisted of continuous monitoring of water levels in pumping and (where available) observation wells prior to, during, and after pumping. Observation wells included available wells within a few hundred feet of the pumped well. Observation wells were

either other wells in the newly installed well nest, or existing wells, screened at intervals either deeper or shallower than the pumped well. For example, BMO-6M was used as an observation well during pumping of BMO-6B and vice versa. Relative to BMO-6B, completed in basin fill, BMO-6M is screened over a deeper interval within the underlying Morita Formation (Section 3.4.4.5 of the main text).

Water levels were typically monitored at 30-second intervals using In-Situ Level Trolls (Trolls). The Trolls, which are submersible instruments containing pressure transducers and data loggers, were initially placed at sufficient depths below the static water levels in the wells to remain submerged throughout each test. Some of the Trolls used in the tests were vented to the atmosphere and therefore measured gauge pressures, while others were absolute pressure transducers. In all cases, an absolute pressure Troll at the surface continuously recorded atmospheric pressure during each test.

The pressure ranges of the Trolls selected for each test were based on the anticipated maximum response in the well in which the Troll was to be deployed. Trolls with a range of 30 pounds per square inch (psi), or approximately 70 feet of water, were typically used. For some of the pumped wells, Trolls with ranges of as much as 100 psi (approximately 230 feet of water) were used.

As an independent verification of the Troll data, water level measurements in pumping and observation wells were collected by hand using an electric water level sounder as frequently as practical. In some cases, hand collection of water levels was not possible over the entire

duration of a test due to binding-up of the water level probe. Binding resulted from crowding within the narrow diameter (2-inch or less) sounding tubes, which accommodated the vent lines and cables for the Trolls, and provided the only access for the water level sounder. In cases where the drawdown in a well exceeded the depth of placement of the Troll (such as at BMO-10GU) the hand-collected data were used during the period that the Troll was not submerged. In cases where the Troll data were of poor quality (excessively noisy), the hand collected data were used exclusively for analysis (e.g., at BMO-13B).

1.5 Data Analysis

Pressure data from the Trolls were downloaded and converted to depths to water and to water level drawdowns for purposes of analysis. Although these data were corrected for changes in atmospheric pressure, the corrections were in most cases negligible with respect to drawdown. In many cases where sufficient measurements were available (for example, at BMO-3B), the hand collected depths to water were converted to water level drawdowns and analyzed independently. As discussed above, in cases where the Troll data were of poor quality, the hand-collected data were used exclusively in the analyses. In all cases, hand-measured depths to water were compared with depths to water calculated from Troll readings as a check on Troll accuracy.

For purposes of analysis, the total number of automatically logged drawdown records was reduced. Typically, the first 5 to 10 records at the beginning of each pumping step were retained for analysis. Then, every second, then third, then fourth, etc, record was retained, until the beginning of the next pumping step. This was necessary in most cases to meet input data size

limits for the software used to analyze the data, and to improve the rate at which automatic parameter estimation could proceed.

At BMO-3B and BMO-6M Troll data were noisy, but useable, and were smoothed prior to analysis. This was accomplished by taking a 7-point moving average one or more times until the desired smoothness was achieved, or by breaking the data into blocks of 20 to 30 values and using the average value of each block in the analysis.

Drawdown and pumping rate data were analyzed using WHIP, a well hydraulics interpretation package developed and marketed by HGC (HGC, 1988). WHIP has solutions that account for variable pumping rates, vertical flow and leakage, wellbore storage, and partial penetration of pumping and observation wells within a vertically anisotropic aquifer. WHIP also accounts for head losses in the pumped well resulting from well efficiency effects. Direct estimation of vertical hydraulic conductivities of the aquifer and an aquitard (if present) is available as part of the vertically anisotropic aquifer solution provided in WHIP.

Hydraulic properties and pumping well efficiency parameters were estimated using either the 'homogeneous aquifer' solution or the 'vertically anisotropic, partially penetrating well solution' (the partial penetration solution) available in WHIP. In many cases, both solutions were used for comparison. The homogeneous aquifer solution assumes full well penetration, allows faster parameter estimation than the partial penetration solution, and accounts for well bore storage effects and vertical leakage (if present) into the aquifer. The homogeneous aquifer solution was used exclusively in cases where the pumped well fully penetrated the basin fill

aquifer (for example, at BMO-3B). The partial penetration solution accounts for partial penetration of pumping and observation wells, for vertical flow within an aquifer, and for leakage into the aquifer from an aquitard. The partial penetration solution was used for either basin fill or bedrock wells that did not fully penetrate the basin fill or bedrock unit they were completed within. Figure N.2 is a schematic illustrating some of the assumptions used in applying the two solutions. Non-horizontal flow typically associated with unconfined (phreatic) aquifer conditions can be approximated by applying a Dupuit correction to either solution

Hydraulic parameters estimated from each test included transmissivity, storage coefficient, and pumped well efficiency parameters. Vertical hydraulic conductivity was estimated when the partially penetrating well solution was used. In each case, pumping and recovery data were analyzed together to obtain the best fit to all collected data. In cases where a good fit to both were not obtained, drawdown and recovery data were analyzed separately. The automatic parameter estimation routines were utilized when needed to improve the fits between measured and simulated drawdowns. In cases where a nearby observation well completed at a different depth interval than the pumping well in the same formation showed no response to pumping (for example at site BMO-10), the lack of response was used to provide a limit on the vertical conductivity.

Because the only wells close enough to serve as observation wells were completed within a different formation than the pumped well or were completed within a different depth interval of the same formation in which the pumped well was completed, drawdowns were not detectable at observation wells in most cases. Accurate estimation of storage coefficient is usually not

possible using only data from the pumped well. Drawdowns in the pumped well are often significantly affected by borehole storage and head losses due to low well efficiency. Therefore, a value of 0.01 was initially assumed for wells completed in unconfined aquifers, and 1 x 10^{-5} for wells which were assumed to be completed in confined aquifers. In general, wells completed in basin fill were assumed to be under unconfined conditions, and those completed in bedrock aquifers located beneath either saturated basin fill or saturated bedrock of an overlying formation were assumed to be under confined conditions. During analysis, the storage coefficient was adjusted to improve the fit between measured and simulated drawdowns at the pumped well even though analyzable observation well data were not obtained.

When using the partial penetration solution, the specification of the screened intervals of pumping and observation wells, and the upper and lower boundaries of the aquifer (and aquitard, if present) were based on the particular conditions at each test location. For basin fill wells, the lower aquifer boundary was usually assumed to coincide with the bedrock contact, and the top of the aquifer to coincide with the static water level in the well. For bedrock wells, the lower boundary was typically assumed to be the base of the well's filter pack, and the top boundary to be either the upper contact of the formation, or the static water level in the well if the static water level was below the upper contact. The effective horizontal hydraulic conductivities of the aquifer intervals penetrated by the pumped wells can be approximated by dividing the estimated transmissivity by the aquifer thicknesses assumed in the respective analyses.

Exceptions to these guidelines occurred at locations where observation wells completed in one formation responded to pumping in another formation. For example, at the location of the

BMO-5 series wells, the well completed in the basin fill (BMO-5B) responded to pumping at the well completed in the underlying Cintura Formation (BMO-5M) and vice versa. Analyses using the partial penetration solution assumed that the aquifer extended from the water table (the static water level in BMO-5B) to the base of the filter pack in BMO-5M. Calculating the effective hydraulic conductivity across the assumed aquifer thickness in this case resulted in some averaging of the basin fill and Cintura Formation conductivities. Other exceptions are discussed in Section 1.5.1.

When analyzing tests at partially penetrating wells using the homogeneous aquifer solution, the pumped well was assumed to be fully penetrating, the aquifer assumed to be only as thick as the pumped well filter pack interval, and any vertical flow was represented as leakage from intervals above or below. These assumptions result in a lower transmissivity than would be calculated using the partial penetration solution because the assumed aquifer thickness would be correspondingly smaller. In most cases, however, the effective hydraulic conductivity computed would be similar to that computed using the partial penetration solution because the reduced transmissivity estimate would be nearly compensated for by the reduced aquifer thickness assumed.

Figure N.3 provides conceptual schematics that illustrate the application of the homogeneous aquifer and partial penetration solutions to the various test analyses described in Section 1.5.1. The schematics indicate the locations of well screens relative to formation boundaries, the selection of aquifer boundaries, and the location of the piezometric surfaces relative to formation and assumed aquifer boundaries.

1.5.1 Results

The results of analyzing pumping rate and drawdown data at the tested wells are provided in Figures N.4 through N.59 and Tables N.2 and N.3. Table N.2 provides the results of all the analyses. Table N.3 summarizes the ranges of hydraulic conductivity and provides a set of representative values for hydraulic properties. Details of the test results are provided in Sections 1.5.1.1 through 1.5.1.15. The results of the analyses for sulfate in samples collected at the time of testing are provided in Section 3.4.4 of the main text.

Multiple interpretations of the data from most tests were performed. The multiple interpretations were considered necessary because a single conceptual model could not *a priori* be determined to be superior to other possible conceptual models. Alternate interpretations were possible even when using one conceptual model and one aquifer solution method. Table N.2 and corresponding figures show the results corresponding to each interpretation and the quality of each interpretation. The quality of each interpretation is reflected in the goodness of fit between measured and simulated drawdowns using a particular set of hydraulic parameters.

The rationale for providing the results of multiple interpretations is that in most cases more than one conceptual model can provide an adequate fit to the data. Furthermore, when using a particular solution method, one set of parameters may not fit all portions of the data equally well. While one interpretation may provide a better fit to some portions of the data, another interpretation may provide a better fit to other portions. Because one interpretation was not always superior, the selection and presentation of only one interpretation may result in the loss of useful information. The final set of parameters provided in Table N.3 are generally based

on averages of the results shown in Table N.2, with the constraint that values considered outliers (based on professional judgment) were not included.

1.5.1.1 BMO-1

Results of testing well BMO-1G are provided in Table N.2 and Figures N.4 through N.6. BMO-1G is completed in the Glance Conglomerate (Section 3.4.4.1 of the main text). Drawdown data were analyzed using both the homogeneous aquifer and partial penetration solutions. There were no nearby wells to serve as observation wells during pumping of BMO-1G. Due to low productivity, BMO-1G was pumped at only two rates as shown in Table N.1.

Using the partial penetration solution, a transmissivity estimate of 75 ft^2/day over an aquifer thickness of 258 feet (the approximate thickness of the water column in the well) was obtained yielding a hydraulic conductivity of 0.29 ft/day. A negligible vertical conductivity of 5 x 10^{-7} ft/day was estimated. Using the homogeneous aquifer solution, transmissivity estimates ranged from 25 feet squared per day (ft^2/day) to 34.8 ft^2/day over a saturated thickness of 150 feet (the approximate length of the well's filter pack) yielding hydraulic conductivity estimates of 0.17 to 0.23 ft/day. Improving the fit to the first step (Figure N.5) reduces the quality of the fit to the third step and the recovery data. Fits to the data were generally better using the homogeneous aquifer solution. Low estimated storage coefficients of 5 x 10^{-6} to 6 x 10^{-6} imply confined conditions.

1.5.1.2 BMO-3

Results of testing BMO-3B are provided in Table N.2 and Figures N.7 through N.10. BMO-3B is completed within the basin fill (Section 3.4.4.2 of the main text). The test was analyzed using the homogeneous aquifer solution because the well fully penetrated the saturated portion of the basin fill. There were no nearby wells to serve as observation wells during pumping of BMO-3B.

Depending on the relative weight given to drawdown or recovery data, transmissivity estimates ranged from 3,000 to 4,500 ft^2/day which imply horizontal conductivities of 23.1 to 34.6 ft/day over a saturated thickness of 130 feet (the approximate saturated thickness of the basin fill at this location). An improved fit to the step 3 drawdowns was obtained by applying a Dupuit correction (Figure N.9). The improved fit implies non-horizontal flow to the well, consistent with a fully penetrating well in a phreatic (unconfined) aquifer, although the low estimated storage coefficients of 1×10^{-4} to 1×10^{-6} imply confined conditions. Analysis of the hand-collected drawdown data (Figure N.10) yielded results nearly identical to the results of analysis of the automatically logged data.

1.5.1.3 BMO-4

Results of testing BMO-4B are provided in Table N.2 and Figures N.11 and N.12. BMO-4B is completed within the basin fill (Section 3.4.4.3 of the main text). The test was analyzed using the partial penetration solution because the well only partially penetrated the saturated portion of the basin fill, and because nearby wells (NWC-03, ROGERS 803, and TVI-713/875)

that were used as observation wells were screened at various depths within the basin fill. During the test, measurable drawdowns were obtained only at the pumped well and observation well NWC-03 CAP. Data from NWC-03 CAP during the first 6 hours of the test were not useful because they were influenced by cycling of NWC-03 and, presumably, other nearby production wells. Only hand collected drawdowns from the pumped well were used in the analysis because automatically logged data were excessively noisy.

Transmissivity was estimated to range from 19,900 to 20,000 ft^2/day, vertical hydraulic conductivity from 0.867 to 1 ft/day, and storage coefficient from 4.15×10^{-4} to 4.5×10^{-4} (Table N.2 and Figures N.11 and N.12) depending on whether data from the pumped well or the observation well (NWC-03 CAP) was analyzed. These transmissivities yield nearly identical horizontal hydraulic conductivities of 39.4 and 39.6 ft/day over an aquifer thickness of 505 feet (the approximate saturated thickness of the basin fill at this location). The estimated storage coefficients are lower than would be expected for an unconfined aquifer.

Background monitoring of BMO-4B and observation well NWC-03 CAP prior to the testing indicated that variations in water level of a few tenths of a foot to more than 1 foot (that are only partially related to changes in barometric pressure) can occur within the vicinity of BMO-4B (Figure N.13). BMO-4B is screened from 500-600 feet below land surface (ft bls), and NWC-03 CAP is screened only to a depth of 160 feet. Although NWC-03 CAP is located only about 200 feet from BMO-4B, the background water level fluctuations in the two wells correlate poorly. The poor correlation indicates that changes in hydraulic head within the basin fill in this area can vary substantially with depth.

1.5.1.4 BMO-5

Results of testing the BMO-5 series wells are provided in Table N.2 and Figures N.14 through N.20. BMO-5B is completed within the basin fill and BMO-5M within the Cintura Formation (Section 3.4.4.4 of the main text). For comparison purposes, tests were analyzed using both the partial penetration solution and the homogeneous aquifer solutions.

Variations in drawdown during the third step of the BMO-5M test, which were reflected in both automatically logged and hand collected data, were not attributable to measured changes in atmospheric pressure or changes in pumping rate (Figure N.14). Although BMO-5M is completed in bedrock (interpreted to be the Cintura Formation) and BMO-5B in the basin fill, measurable responses were obtained at BMO-5M during pumping at BMO-5B and vice versa. These responses indicate significant hydraulic interaction between the basin fill and the upper bedrock at this location.

When analyzing the test data from pumping BMO-5B using the partial penetration solution, the upper portion of the Cintura Formation was assumed part of the same aquifer as the basin fill. This assumption is justified by the response of BMO-5M to pumping at BMO-5B and vice versa, and allowed estimation of hydraulic parameters using BMO-5M as an observation well during pumping of BMO-5B and vice versa. When using an observation well completed in a different formation than the pumping well, estimates of horizontal and vertical hydraulic conductivity and storage coefficient will be affected by the properties of both formations.

Using the partial penetration solution and only data from the pumping well (BMO-5B), a transmissivity estimate of 25,000 ft^2/day, a vertical hydraulic conductivity estimate of 3 ft/day, and a storage coefficient estimate of 0.076 were obtained (Figure N.15). Using only data from the observation well (BMO-5M) during pumping of BMO-5B, a transmissivity estimate of 30,000 ft^2/day, a vertical hydraulic conductivity estimate of 4.3 ft/day, and a storage coefficient estimate of 1.05×10^{-4} were obtained (Figure N.16). The transmissivity and vertical hydraulic conductivity estimates are similar but the estimated storage coefficients differ by 2 orders of magnitude. The low estimate obtained from the observation well (BMO-5M) data is likely more representative of the Cintura Formation in which it is completed than of the basin fill aquifer. The range of estimated transmissivities imply a range in horizontal conductivity of 93.3 ft/day to 95.2 ft/day over an assumed aquifer thickness of 315 feet. The assumed aquifer thickness was defined by the static water level in BMO-5B and the base of the filter pack in BMO-5M.

Analyzing data from pumping of BMO-5M using the partial penetration solution resulted in somewhat different parameters even though the aquifer thickness was assumed to be the same and a response to pumping BMO-5M was measured at BMO-5B. Using only data from the pumping well (BMO-5M), a transmissivity of 2,200 ft^2/day and a vertical hydraulic conductivity estimate of 3 ft/day were obtained (Figure N.18). Using only data from the observation well (BMO-5B) during pumping of BMO-5M, a transmissivity estimate of 528 ft^2/day, a vertical hydraulic conductivity estimate of 1.1 ft/day, and a storage coefficient of 0.035 were obtained (Figure N.19). The transmissivity estimates are one to two orders of magnitude lower than estimated from the data obtained from pumping BMO-5B although the vertical conductivity estimates are similar. The range of transmissivities implies a range in horizontal conductivities

of 1.7 ft/day to 7 ft/day over an aquifer thickness of 315 feet. The analysis of data from the observation well (BMO-5B) yields a significantly lower horizontal conductivity and higher storage coefficient than data from the pumping well (BMO-5M). The higher storage estimate obtained from the observation well data is likely more representative of the basin fill in which it is completed than of the Cintura Formation. Conversely, the transmissivity estimate is likely more representative of the pumped (Cintura) formation.

That transmissivity estimates are dominated by the pumped formation is consistent with the Cintura Formation having a lower average conductivity than the basin fill. The similar vertical conductivity estimates represent some average over the two hydrostratigraphic units. The relatively high estimates of vertical conductivity are consistent with the responses measured in one unit while the other is pumped. The interaction between the two units is also consistent with the lithologic logs which show an absence of clayey material sometimes reported near the bottom of the basin fill. The cross-formation responses suggest that either the upper portion of the Cintura Formation is so weathered, fractured, poorly cemented, or coarse-grained, that its behavior is hydraulically similar to the basin fill, or that near-vertical permeable structures penetrating the Cintura Formation (or both the Cintura Formation and basin fill) exist at this location.

When using the homogeneous aquifer solution to analyze data from the pumping wells, full well penetration and horizontal flow were assumed, and vertical flow (leakage) into the portion of the aquifer penetrated by the pumped well filter pack was approximated by assigning a

leakance term. The assumed aquifer thicknesses of 145 feet for BMO-5B, and 130 feet for BMO-5M, are the approximate lengths of the respective filter pack lengths.

A transmissivity estimate of 3,370 ft^2/day, a leakance of 0.2/day, and a storage coefficient of 6.9 x 10^{-3} were obtained from the data from BMO-5B (Figure N.17). This transmissivity implies a conductivity of only 23.2 ft/day over an aquifer thickness of 145 feet, which is substantially lower than the estimate obtained using the partial penetration solution. The rather large leakance value of 0.2/day implies significant vertical flow. A transmissivity estimate of 986 ft^2/day, a leakance of 0.06/day, and a storage coefficient of 1.9 x 10^{-3} were obtained for the data from BMO-5M (Figure N.20). This transmissivity implies a horizontal conductivity of 7.6 ft/day over an aquifer thickness of 130 feet, which is at the high end of the range estimated using data from the pumping well and data from the observation well in the partial penetration analysis.

In general, slightly better fits to the pumping well data, especially to the third step, were obtained using the homogeneous aquifer solutions for both the BMO-5B and BMO-5M test data (Figures N.17 and N.20). These improved fits could only be obtained by assuming large leakances which imply vertical interaction between basin fill and Cintura Formation. These results imply the existence of high vertical permeability structures in the vicinity of the BMO-5 wells as discussed above.

1.5.1.5 BMO-6

Results of testing the BMO-6 series wells are provided in Table N.2 and Figures N.21 through N.26. BMO-6M is completed in bedrock interpreted to be the Cintura Formation and BMO-6B in both basin fill and the weathered upper portion of the Cintura Formation (Section 3.4.4.5 of the main text). Measurable responses were not obtained at BMO-6M during pumping at BMO-6B or vice versa. The data from BMO-6M were analyzed using both the partial penetration solution and the homogeneous aquifer solutions for comparison purposes. The data from BMO-6B were analyzed using only the homogeneous aquifer solution because the well fully penetrated the saturated portion of the basin fill.

Only the data from the first two steps of the test at BMO-6B were interpretable for hydraulic properties. Figure N.21 shows the raw drawdown data, Figure N.22 shows the fit to the first two steps, and Figure N.23 shows the fit to all the data. Features in the drawdown data from BMO-6B that made the third step uninterpretable for hydraulic properties include the rapid increases in drawdown during the initial portion of the third step and from 540 minutes to the end of pumping. The rapid increases in drawdown that occurred in the early and latter portions of the third step cannot be attributed to changes in pumping rate or to low well efficiency. Furthermore, the changes in slope of the drawdown data (Figure N.21) were detected over the same depth intervals in the pumping and recovery data. This behavior likely results from dewatering of relatively thin water bearing zones that supply most of the water to the well or to the development of seepage faces as the water level in the well dropped below one or more of these relatively thin water bearing zones. Once seepage faces develop, the well is decoupled from these water bearing zones, and the rate at which water flows into the well from these zones

is independent of the water level in the well. Under these conditions the standard solutions used to analyze hydraulic tests are invalid.

Using the homogeneous aquifer solution to analyze data from the first two steps, the transmissivity at BMO-6B was estimated to be 170 ft^2/day over a saturated thickness of 75 feet yielding a hydraulic conductivity of 2.26 ft/day (Figures N.22 and N.23). The estimated storage coefficient of 1 x 10^{-4} suggests confined behavior.

Using the partial penetration solution, the transmissivity at BMO-6M was estimated to be 2,870 ft^2/day over an aquifer thickness of 190 feet (the approximate depth of penetration of the well into the Cintura Formation) (Figure N.24). In performing the analysis, the basin fill was treated as an aquitard (or confining layer that is a source of leakage, Figure N.2 and N.3) but having the same vertical conductivity as the Cintura Formation. The vertical hydraulic conductivities of the Cintura Formation and basin fill were estimated to be negligible (1 x 10^{-6} ft/day), indicating that the basin fill and the Cintura Formation are essentially isolated hydraulically. Analysis of the hand-collected drawdown data at BMO-6M yielded results nearly identical to the results of analysis of the automatically logged data (Figure N.26). Using the homogeneous aquifer solution, a transmissivity of 2,100 ft^2/day over an aquifer thickness of 130 feet (the approximate length of the filter pack) was obtained (Figure N.26). The aquifer was assumed to be only as thick as the filter pack length, and flow to be horizontal, with no vertical leakage from above or below the aquifer interval penetrated by the filter pack.

These transmissivities and assumed aquifer thicknesses yield similar hydraulic conductivities of 15.1 and 16.2 ft/day, respectively. Estimated storage coefficients of 1×10^{-5} are consistent with confined conditions.

The estimated low hydraulic conductivity of the material penetrated by BMO-6B, which included basin fill and weathered Cintura Formation, and the changes in slopes in the drawdown, are consistent with a heterogeneous material that transmitted water to BMO-6B primarily via higher conductivity (coarser-grained) zones. These zones are likely thin and/or discontinuous. The calculated conductivity represents an average over the entire saturated portion of the basin fill and top of the Cintura Formation penetrated by the well and is influenced by the presence of thick intervals having a large proportion of fine-grained material. These fine-grained materials, described in the lithologic logs for this well (Appendix J), presumably have a low conductivity. The low calculated conductivity for the mixture of basin fill and weathered top of the Cintura Formation penetrated by BMO-6B seems anomalous in comparison to the relatively high conductivity calculated for the Cintura Formation at co-located well BMO-6M.

1.5.1.6 BMO-7 and MW-1

Results of testing BMO-7M and MW-1 are provided in Table N.2 and Figures N.27 through N.37. BMO-7M is completed in the Morita Formation and MW-1 in the basin fill (Section 3.4.4.6 of the main text). Tests were analyzed using both the partial penetration and the homogeneous aquifer solutions.

Although BMO-7M is completed in the Morita Formation and MW-1 in the basin fill, and MW-1 is located nearly 500 feet east of BMO-7M, a measurable response was obtained at MW-1 during pumping of BMO-7M. Conversely, BMO-7M did not respond to pumping at MW-1, perhaps because MW-1 was pumped at only one low rate of 11 gpm (Table N.1) whereas BMO-7 was pumped at three rates (11, 23, and 34 gpm). The response of MW-1 to pumping at BMO-7M indicates the potential for vertical interaction between basin fill and the shallow Morita Formation at this location.

Although well efficiency parameters were estimated for BMO-7M, the solutions were not very sensitive to these parameters, and applying them provided little improvement in the fit between measured and simulated drawdowns. Regardless, the well efficiency corrections were applied as shown in Table N.3.

Using the partial penetration solution to analyze drawdowns at BMO-7M, a transmissivity estimate of 105 ft^2/day over a thickness of 190 feet (the approximate depth of penetration of the well into the Morita Formation) and a vertical conductivity of 1 x 10^{-5} ft/day were obtained. This transmissivity and aquifer thickness yield a hydraulic conductivity of 0.62 ft/day (Figure N.27). The analysis assumed that the basin fill was a source of water to the Morita Formation at BMO-7M via downward flow or leakage. The basin fill was treated as an aquitard (or confining layer that is a source of leakage, Figure N.2 and N.3) but having the same vertical conductivity as the Morita Formation. The vertical hydraulic conductivities of the Morita Formation and basin fill were estimated to be low (1 x 10^{-5} ft/day), indicating little hydraulic interaction between the two formations. Attempts to treat the basin fill as part of the same

aquifer as the Morita Formation (as in the partial penetration analyses for BMO-5) did not provide reasonable fits to the data.

Using the homogeneous aquifer solution, a transmissivity estimate of 81 ft^2/day over a thickness of 130 feet (the approximate length of the well's filter pack) was obtained Figure N.31). This transmissivity and aquifer thickness yield a horizontal conductivity of approximately 0.55 ft/day. Only the aquifer interval penetrated by the filter pack was assumed to provide water to the well. Flow was assumed to be primarily horizontal with no significant leakage from above or from below the screened interval of the well.

Assuming a somewhat large effective well radius of 0.5 feet provided the best fit to all the data when using the homogeneous aquifer solution. This suggests an effective bore radius that is larger than nominal due to washout of the borehole during drilling. The increased bore radius would increase the storage of the filter pack and would increase the effective well radius provided the filter pack has higher storage than the aquifer. The increased diameter of the borehole will, however, only affect the results to the extent that the filter pack has different storage properties than the aquifer. Borehole washout at BMO-7M is likely, by analogy with BMO-8M and BMO-13M where it has been confirmed by video and caliper logging.

The fits between measured and simulated drawdowns were poor for both the partial penetration and homogeneous aquifer solutions as shown in Figures N.27 and N.31. Improved fits to the third step and recovery data were obtained by applying a Dupuit correction to the BMO-7M drawdown data (Figures N.28 and N.32) regardless of whether the well was

considered fully or partially penetrating. Using the Dupuit correction with the partial penetration solution, a transmissivity estimate of 125 ft^2/day over a thickness of 190 feet and a vertical conductivity of 0.45 ft/day were obtained, implying a horizontal conductivity of 0.66 ft/day. This is very close to the 0.62 ft/day obtained without the Dupuit correction. Using the Dupuit correction with the homogeneous aquifer solution, a transmissivity estimate of 170 ft^2/day over a thickness of 100 feet (the length of the screen) was obtained, implying a horizontal conductivity of 1.7 ft/day. This estimate is more than double the estimate of 0.55 ft/day obtained without the Dupuit correction.

The improved fits when using the Dupuit correction suggest the occurrence of non-horizontal flow similar to that encountered when pumping an unconfined (phreatic) aquifer. Analysis of the hand-collected drawdown data at BMO-7M yielded results nearly identical to the results of analysis of the automatically logged data (Figure N.28 and N.29). The improvement of the fit when using the partial penetration solution with the Dupuit correction and a higher vertical conductivity (Figure N.28) is consistent with the apparent response of MW-1 to pumping in BMO-7M because it implies a vertical flow component. However, a reasonably good fit to all the data was obtained by assuming full penetration with no vertical leakage (Figure N.32).

Although improved fits were obtained to the third step and recovery data by applying a Dupuit correction, Figures N.27 and N.31 indicate that the fit to the first and second steps is rather poor. An analysis using the partial penetration solution that considered only the first step is shown in Figure N.30. A transmissivity estimate of 278 ft^2/day over a thickness of 190 feet, and a vertical conductivity of 0.1 ft/day were obtained, implying a horizontal conductivity of 1.5

ft/day. This estimate is more than double the estimate of 0.66 ft/day obtained using all the data. Again, the vertical conductivity estimate implies vertical interaction and is consistent with the apparent response at MW-1. The higher transmissivity estimate obtained from the first step suggests that the effective conductivity of the Morita Formation may decrease as drawdown increases, possibly due to dewatering of relatively isolated, relatively low storage, higher permeability zones as pumping rate increases. While this suggests dual porosity, a dual porosity effect was not evident in the drawdown data.

The response at MW-1 to pumping at BMO-7M was also analyzed using the partial penetration solution. This required the assumption that the basin fill and portion of the Morita Formation penetrated by BMO-7M constituted a single aquifer (similar to the analysis at BMO-5). A transmissivity of 16,100 ft^2/day over a thickness of 440 feet and a vertical conductivity of 0.064 ft/day were obtained (Figure N.33). The assumed aquifer thickness of 440 feet is defined by the static water level in MW-1 and the base of the filter pack in BMO-7M. The transmissivity estimate is anomalously high for the Morita Formation because it represents some averaging of the basin fill and Morita Formation at this location. The implied horizontal conductivity of 37 ft/day is much larger than the estimates for the Morita Formation based on pumping well data but is less than half the basin fill conductivity estimates obtained from analysis of pumping MW-1 as discussed below. The approximate arithmetic average of the conductivities of the basin fill and Morita Formation is 37 ft/day at this location.

Estimates of storage coefficient from the various analyses of data obtained from pumping BMO-7M varied from 4.6×10^{-5} to 0.42 depending on the method of analysis, and therefore

range from values typical of confined to unconfined conditions. The lowest value was obtained from analysis of the response at MW-1 to pumping at BMO-7M. This is to be expected because measurable drawdowns would be very unlikely considering the relatively short duration of pumping, the relatively low pumping rate at BMO-7M, and the lateral and vertical distance between the well screens, unless the effective storage coefficient was low.

Analysis of data obtained during pumping of MW-1 using the partial penetration solution provided a transmissivity estimate of 19,200 ft^2/day over a thickness of 257 feet (the thickness of saturated basin fill at this location), yielding a hydraulic conductivity of 75 ft/day (Figure N.34). The vertical hydraulic conductivity was estimated to be negligible. Using the homogeneous aquifer solution, transmissivity estimates ranging from 7,790 ft^2/day to 11,500 ft^2/day over a thickness of 90 feet (the approximate length of the well's filter pack) were obtained, yielding hydraulic conductivity estimates of 87 to 128 ft/day (Figures N.35 through N.37). Analysis of the hand-collected data at MW-1 yielded a higher transmissivity compared to the results of analysis of the automatically logged data (Table N.3). The estimated storage coefficients of 0.1 to 0.01 are consistent with unconfined conditions.

The ranges of estimates of hydraulic properties obtained from testing of BMO-7M and MW-1 are indicative of the complexity of the hydraulic system at that location. Some interaction between the basin fill and Morita Formation is indicated by the response of MW-1 to pumping at BMO-7M. This interaction could be due to weathering or fracturing of the upper portion of the Morita Formation that increases its permeability to levels more typical of basin fill, or to near-vertical structures that penetrate both Morita Formation and basin fill at this location. Such

structures would be consistent with the low effective storage coefficient estimated from the MW-1 response to BMO-7M pumping. However, reasonable fits to drawdown data obtained during pumping of MW-1, or to later portions of the drawdown data at BMO-7M, did not require the assumption of significant vertical flow, which would seem to be necessary if pumping from the bedrock at BMO-7M can affect basin fill water levels at MW-1. These apparent inconsistencies are not resolvable using standard analytical aquifer test methods.

1.5.1.7 BMO-8

Results of testing the BMO-8 series wells are provided in Table N.2 and Figures N.38 through N.43. BMO-8M is completed in the Morita Formation and BMO-8B in the basin fill (Section 3.4.4.7 of the main text). The data from BMO-8B were analyzed using the partial penetration solution because the well did not fully penetrate the saturated portion of the basin fill. The data from BMO-8M were analyzed using both the partial penetration solution and the homogeneous aquifer solution for comparison purposes. No measurable responses were obtained at BMO-8M during pumping at BMO-8B or vice versa. Due to excessive noise in the automatically logged data during pumping, hand collected data were used exclusively to analyze the pumping portions of the tests. Because the noise did not affect the automatically logged recovery data, the automatically logged data were used to analyze the recovery portions of the tests.

Using the homogeneous aquifer solution, the transmissivity at BMO-8B was estimated to be 3,500 ft^2/day over a saturated thickness of 197 feet (the thickness of saturated basin fill at this

location) yielding a hydraulic conductivity of 17.8 ft/day. A storage coefficient of 0.01 was estimated, consistent with unconfined conditions (Figure N.38).

Using the partial penetration solution, the transmissivity at BMO-8M was estimated to range from 115 to 146 ft^2/day over an aquifer thickness of 725 feet (the approximate depth of penetration of the well into the Morita Formation), depending on whether drawdown or recovery data were analyzed. This transmissivity and aquifer thickness yield a hydraulic conductivity range of 0.16 to 0.20 ft/day (Figures N.39 and N.40). The vertical hydraulic conductivity was estimated to be negligible (1×10^{-5} ft/day). In performing the analysis, the Morita Formation was considered to be hydraulically isolated from the basin fill. A large effective well radius of 1 foot improved the quality of fit to the data. Using the homogeneous aquifer solution, transmissivity estimates ranged from 20 to 31 ft^2/day over an aquifer thickness of 135 feet (the approximate length of the filter pack), yielding hydraulic conductivities ranging from 0.15 to 0.23 ft/day (Figures N.41 and N.42). The aquifer was assumed to be only as thick as the filter pack length, and flow to be horizontal, with no vertical leakage from above or below the aquifer interval penetrated by the filter pack. Effective well radii of 0.33 and 0.43 feet improved the quality of fit to the data. Using the Dupuit correction (Figure N.42) also improved the overall fit to the data, suggesting the occurrence of the non-horizontal flow conditions typical when pumping an unconfined (phreatic) aquifer.

Because fits to the first step were slightly poor, an additional analysis was performed using the partial penetration solution that considered only the first step data (Figure N.43). A transmissivity of 220 ft^2/day over an aquifer thickness of 725 feet, and a vertical conductivity of

1 x 10^{-3} ft/day were obtained. This transmissivity and aquifer thickness yield a horizontal hydraulic conductivity of 0.30 ft/day.

Estimates of storage coefficient ranged from 0.12 to 0.40 depending on the method of analysis, and are inconsistent with the expected confined conditions at BMO-8M. The estimated storage coefficients would be even higher if, as discussed below, a large effective well radius was not assumed in the analyses. The assumption of relatively large storage coefficients and large effective well radii provided the best overall fits to the data.

The improved fits to the data when specifying an effective well radius of up to 1 foot in using the partial penetration solution indicate that the effective bore radius was larger than nominal due to washout of the borehole during drilling. A similar behavior was encountered when analyzing tests at BMO-7M (Section 1.5.1.6). Borehole washout was confirmed at BMO-8M by video and caliper logging. Washout would increase the storage of the filter pack and could increase the effective well radius assuming that the filter pack has a higher storage that the formation. However, it seems unlikely that washout would be extensive enough to justify an effective radius as large as 1 foot. The effective radii used in the homogeneous aquifer solutions (of 0.43 feet or less, Table N.3) are more reasonable.

1.5.1.8 BMO-9

Results of testing BMO-9M are provided in Table N.2 and Figures N.44 and N.45. BMO-9M is completed in the Morita Formation (Section 3.4.4.8 of the main text). The data

were analyzed using the homogeneous aquifer solution because reasonable fits to measured drawdowns were not obtained using the partial penetration solution. A good fit to all the data was not possible using only one set of parameters. Therefore, two analyses were performed; one focused on the late time drawdown and recovery data and the other on the first pumping step.

Transmissivity estimates range from 28 ft^2/day (using the late time and recovery data, Figure N.44) to 101 ft^2/day (using only step 1 data, Figure N.45) over an aquifer thickness of 130 feet (the approximate length of the well's filter pack), yielding hydraulic conductivities of 0.21 and 0.78 ft/day, respectively. Only the aquifer interval penetrated by the filter pack was assumed to provide water to the well. Flow was assumed to be horizontal with no significant leakage from above or from below the filter pack interval of the well. The storage coefficient estimated from the late time and recovery data was 0.24, and from step 1 data was 0.021 (Table N.2). The value of 0.24 is typical of an unconfined aquifer.

When focusing on the late time and recovery data, specifying a rather large effective well radius of 0.81 feet provided the best overall fit, suggesting that the bore radius was larger than nominal due to washout, as at BMO-7M and BMO-8M. As shown in Figure N.44, the fit to the recovery portion of the data is good, but the fit to the pumping portion of the data is poor. In this case the assumption of both a large storage coefficient and a large effective well radius were needed to provide the best fit to all the data, especially the recovery data. When considering only step 1 the specification of a large well radius was not necessary to provide a good fit to the data; however, the aquifer properties that provided a good fit to step 1 did not provide good fits to steps 2 or 3 or to the recovery data.

1.5.1.9 BMO-10

Results of testing the BMO-10G well nest are provided in Table N.2 and Figures N.46 through N.48. Both BMO-10GU and BMO-10GL are completed in the Glance Conglomerate (Section 3.4.4.9 of the main text). BMO-10GU is about 95 feet north of BMO-10GL. Tests of both wells were analyzed using the homogeneous aquifer solution. No measurable responses were obtained at BMO-10GU during pumping at BMO-10GL or vice versa. Due to low productivity, BMO-10GL was pumped at only two rates as shown in Table N.1.

The drawdown at BMO-10GU displayed several significant changes in slope during both steps of the test (Figure N.46) even though pumping rate was relatively constant during each step. The changes in slope are interpreted to represent changes in hydraulic responses due to discontinuities in the aquifer materials. The drawdowns during the latter portion of the first step and during the higher pumping step could not be interpreted; only the early portion of the first step and the latter portion of the recovery data were interpretable for hydraulic parameters. The decrease in data frequency once the drawdown exceeded about 70 feet is due to the dropping of the water level below the Troll in the well. Hand collected data are displayed in the time interval during which the Troll was not submerged.

Transmissivity estimates of 4.92 ft^2/day over an assumed aquifer thickness of 140 feet, and 0.451 ft^2/day over a thickness of 135 feet were obtained at BMO-10GU and BMO-10GL, respectively (Figures N.47 and N.48). The approximate filter pack lengths for BMO-10GU and BMO-10GL are 140 feet and 135 feet, respectively. In analyzing the data, only the aquifer interval penetrated by each well's filter pack was assumed to provide water to the well. Flow

was assumed to be horizontal with no significant leakage from above or from below the filter pack interval of either well. These transmissivities and thicknesses yield hydraulic conductivity estimates of 0.035 ft/day for BMO-10GU and 0.0033 ft/day for BMO-10GL.

The estimated storage coefficients of 0.21 at BMO-10GU and of 0.0138 at BMO-10GL are generally typical of unconfined conditions. As at BMO-8M, the best fit to the data at BMO-10GL required the assumption of a large effective well radius and a somewhat larger storage coefficient than would seem typical for the expected confined conditions. Assuming a rather large effective well radius of 2.36 feet provided the best fit to all the BMO-10GL data. This value seems too large to be consistent with borehole washout but does indicate that the test was strongly influenced by storage effects regardless of the mechanism.

The discontinuities evident in the BMO-10GU drawdown (Figure N.46) during pumping were reflected in the recovery data. These discontinuities likely result from the development of seepage faces as the water level in the well dropped below a succession of relatively thin water bearing zones that supply most of the water to the well. Once seepage faces develop, the well is decoupled from these water bearing zones in that the rate at which water flows into the well from these zones is independent of the water level in the well. Under these conditions the standard solutions used to analyze hydraulic tests are invalid. Possibly BMO-10GL would have displayed similar behavior had water levels in that well dropped below the top of the screened interval during testing.

1.5.1.10 BMO-11

Results of testing BMO-11G are provided in Table N.2 and Figures N.49 and N.50. BMO-11G is completed in the Glance Conglomerate (Section 3.4.4.10 of the main text). The data were analyzed using both the partial penetration solution and the homogeneous aquifer solution for comparison purposes.

Using the partial penetration solution, the transmissivity was estimated as 115 ft^2/day over an aquifer thickness of 325 feet (the approximate length of the water column in the well) yielding a hydraulic conductivity estimate of 0.35 ft/day. Vertical conductivity was estimated as 0.01 ft/day. Using the homogeneous aquifer solution, the transmissivity was estimated as 60 ft^2/day over an assumed aquifer thickness of 180 feet (the approximate filter pack length of the well). The aquifer was assumed to be only as thick as the filter pack length, and flow to be horizontal, with no vertical leakage from above or below the aquifer interval penetrated by the filter pack. The assumption of negligible vertical leakage is generally consistent with the relatively low vertical conductivity of 0.01 ft/day estimated using the partial penetration solution. Estimated storage coefficients of 1×10^{-4} to 1×10^{-5} are consistent with confined conditions.

As shown in Table N.2, significant non-linear head losses occurred in the well at the higher pumping rates, as reflected in the well loss exponents that were estimated to range from 1.9 to 2.8 depending on the method of analysis.

1.5.1.11 BMO-13

The results of testing the BMO-13 series wells are provided in Table N.2 and Figures N.51 and N.52. BMO-13B is completed in the basin fill and BMO-13M in the Mural Limestone (Section 3.4.4.11 of the main text). Drawdown data from BMO-13B were analyzed using the partial penetration solution because the well does not quite fully penetrate the basin fill aquifer. Data from BMO-13M were analyzed using the homogeneous aquifer solution. Reasonable fits to measured drawdowns at BMO-13M could not be obtained using the partial penetration solution. No measurable responses were obtained at BMO-13M during pumping at BMO-13B or vice versa. Only hand collected data from BMO-13B were analyzed because the automatically logged data were excessively noisy.

As shown in Figure N.51, the interpretation of the test data from BMO-13B was complicated by short term changes in drawdown that are noticeable during the third step of the test. These were due to periodic cessation of drilling at nearby well BMO-13M at which times no water was airlifted from the formation. BMO-13B is approximately 120 feet from BMO-13M. The effect of water removal from the nearby well could be ignored in the analysis because the drilling began about 45 minutes prior to testing, and the water removed during drilling resulted in a relatively constant drawdown prior to the start of the test. The short term variations in drawdown caused by periodic cessation of drilling were sufficiently symmetrical that they did not need to be removed from the data set during the analysis.

Using the partial penetration solution, a transmissivity estimate of 7,500 ft^2/day over an assumed aquifer thickness of 313 feet and a storage coefficient of 0.01 were obtained at BMO-

13B. The approximate saturated thickness of the basin fill is 313 feet at this location. The transmissivity and assumed aquifer thickness yield a horizontal hydraulic conductivity of 24 ft/day. The response at BMO-13B to airlifting at BMO-13M suggests that the actual storage coefficient may be less than 0.01.

Using the homogeneous aquifer solution, a transmissivity estimate of 0.661 ft^2/day over an assumed aquifer thickness of 130 feet and a storage coefficient of 0.019 were obtained at BMO-13M. 130 feet is the approximate length of the well's filter pack. The aquifer was assumed to be only as thick as the filter pack length, and flow to be horizontal, with no vertical leakage from above or below the aquifer interval penetrated by the filter pack. The transmissivity and assumed aquifer thickness yield a horizontal hydraulic conductivity of 0.0051 ft/day. Assuming a rather large effective well radius of 1.13 feet provided the best fit to all the data. As discussed in Section 1.5.1.6, a large effective well radius is consistent with borehole washout during drilling. Washout was confirmed at BMO-13M by video and caliper logging. Although the effective well radius of 1.13 feet seems too large to be consistent with borehole washout, it indicates that the test was strongly influenced by storage effects.

The estimated storage coefficients of 0.01 at BMO-13B and 0.019 at BMO-13M are both typical of unconfined conditions. As at BMO-8M, the best fit to the data at BMO-13M required the assumption of a large effective well radius and a somewhat larger storage coefficient than would seem typical for the expected confined conditions.

1.5.1.12 GARNER

Results of testing the GARNER well are provided in Table N.2 and Figure N.53. The GARNER well is a private well interpreted to be completed within the Cintura Formation (but previously reported to be completed in Morita Formation). Data were analyzed using the homogeneous aquifer solution. As shown in Table N.1, the GARNER well was pumped at only a single rate due to constraints at the well.

A transmissivity estimate of 142 ft^2/day over a thickness of 120 feet (the approximate length of the well's filter pack) was obtained, yielding a hydraulic conductivity estimate of 1.18 ft/day. A storage coefficient of 1×10^{-5} was obtained, consistent with confined conditions. The analysis assumed strictly horizontal flow within the aquifer interval penetrated by the well screen, with no vertical leakage into this interval from above or below.

1.5.1.13 TM-02A

Results of testing TM-02A are provided in Table N.2 and Figures N.54 and N.55. TM-02A is a groundwater monitoring wells completed within the Glance Conglomerate. Data were analyzed using both the partial penetration and the 'homogeneous aquifer' solutions. As shown in Table N.1, TM-02A was pumped at only a single rate for a short period of time due to rapid dewatering. As a result of the low yield, the drawdown during pumping was significantly impacted by borehole storage.

Using the partial penetration solution, a transmissivity estimate of 15.7 ft^2/day over an aquifer thickness of 346 feet was obtained, yielding a hydraulic conductivity of 0.045 ft/day. 346 feet is the approximate depth of the penetration of the well into the Glance Conglomerate. A storage coefficient of 0.041 was obtained.

Using the homogeneous aquifer solution a transmissivity of 2 ft^2/day over a thickness of 100 feet was obtained, yielding a hydraulic conductivity estimate of 0.02 ft/day. 100 feet is the approximate length of the well's filter pack. The analysis assumed strictly horizontal flow within the aquifer interval penetrated by the well screen, with no vertical leakage into this interval from above or below. A storage coefficient of 2×10^{-4} was obtained, which seems more reasonable for the expected confined conditions at this well.

In fitting the data at TM-02A, assuming rather large effective well radii of 1.66 to 2.36 feet provided the best fit to the data. Although these values seem too large to be consistent with borehole washout, they indicate that the test was strongly influenced by storage effects.

1.5.1.14 NWC-03

Results of testing NWC-03 are provided in Table N.2 and Figure N.56. NWC-03 is a public supply well owned and operated by Naco Water Company that is completed within the basin fill. The test was conducted by monitoring drawdown at NWC-03 CAP, a former production well located approximately 25 feet from NWC-03, during a typical pumping cycle at

NWC-03. As shown in Table N.1, NWC-03 was pumped at only a single rate of approximately 52 gpm, which was estimated from the totalizer flow meter on NWC-03.

Drawdown data were analyzed using only the partial penetration solution because both the pumping well (NWC-03) and the observation well (NWC-03 CAP) partially penetrate the basin fill aquifer. NWC-03 CAP, with a total depth of only 179 ft bls, is screened over a shallower interval than NWC-03, which is screened from 252 to 312 ft bls. A transmissivity estimate of 21,000 ft^2/day over an aquifer thickness of 505 feet (based on the basin fill aquifer thickness encountered in BMO-4B), a vertical conductivity of 3.45 ft/day, and a storage coefficient of 4.53 x 10^{-4} were obtained. The transmissivity estimate implies a horizontal conductivity of 41.6 ft/day. The low storage coefficient is consistent with confined conditions.

1.5.1.15 TVI-875

Results of testing TVI-875 are provided in Table N.2 and Figures N.57 through N.59. TVI-875 is completed within the basin fill. The test was analyzed using the partial penetration solution because the well only partially penetrated the saturated portion of the basin fill, and because nearby wells (BMO-4B, NWC-03 CAP, and TVI-713) that were used as observation wells were screened at various depths within the basin fill. During the test, measurable drawdowns were obtained at all three observation wells. Drawdowns in the pumped well were not measured due to inaccessibility for water level monitoring.

Water level monitoring before and after the test indicated that water levels in all observation wells were increasing at a rate of approximately 2.92 x 10^{-5} ft/min. This trend was subtracted from the drawdown data prior to analysis. Although measurable drawdowns were obtained at all three observation wells, reasonable estimates of hydraulic parameters were not obtainable from drawdown data at NWC-03 CAP and BMO-4B using the partial penetration solution in WHIP. The Neuman unconfined aquifer solution available in AQTESOLV (HydroSOLVE, Inc., 2000) was therefore used to analyze these data. As with WHIP, wells were treated as partially penetrating when using the Neuman solution.

Transmissivity was estimated to range from 21,860 to 28,850 ft^2/day, vertical hydraulic conductivity from 8.6 x 10^{-3} to 1 ft/day, and storage coefficient from 6.9 x 10^{-6} to 3.2 x 10^{-3} (Table N.2 and Figures N.57 through N.59) depending on which observation well was analyzed and on the solution method. When using the Neuman solution, vertical conductivities were calculated from the resulting beta factors. The estimated transmissivities yield horizontal hydraulic conductivities ranging from 43.3 to 57.1 ft/day over an estimated aquifer thickness of 505 feet (based on the thickness encountered in BMO-4B). The horizontal hydraulic conductivities of 43.3 and 57.1 ft/day obtained using the Neuman solution bracket the estimate of 47.5 ft/day obtained using WHIP. The estimated storage coefficients are lower than would be expected for an unconfined aquifer.

1.6 Discussion

As shown in Table N.3, transmissivities are highest in basin fill and lowest in the Mural Limestone and Glance Conglomerate, with the Cintura and Morita Formations having intermediate values. Calculated hydraulic conductivities over the entire assumed aquifer thicknesses (which represent vertically averaged values) are also highest in the basin fill and lowest in the Mural Limestone and Glance Conglomerate. Although a number of different conceptual models were used to interpret data at some of the test locations, the hydraulic conductivity estimates shown in Table N.3 are similar to previous estimates for the site (Table 6 of the main text). The differences between maximum and minimum hydraulic conductivity estimates at individual test locations are greatest for bedrock wells, and are within a factor of two at all locations except at BMO-5M, BMO-7M, and BMO-9M.

Some of the important results of the hydraulic testing include:

1. Vertical hydraulic conductivities in bedrock aquifers are likely small except in the vicinities of BMO-5M and BMO-7M.

2. Responses in basin fill to pumping in the Cintura and Morita Formations at BMO-5M and BMO-7M, respectively, imply that either the upper bedrock and basin fill have similar hydraulic properties or that permeable vertical structures exist that connect them hydraulically at these locations.

3. Vertically averaged horizontal hydraulic conductivities (calculated over the assumed aquifer thicknesses) can vary by 2 to 3 orders of magnitude in both basin fill and bedrock.

4. Hydraulic conductivities generally decrease with depth in the bedrock.

5. Flow within bedrock aquifers may be dominated (at least locally) by higher permeability zones of limited thickness and/or lateral extent.

6. In areas where relatively thin higher permeability zones dominate the bedrock flow system, the permeability of these zones could be substantially higher than the (vertically averaged) estimates shown in Table N.3.

The presence of relatively thin permeable zones in bedrock is indicated by the discontinuities in the measured drawdowns during pumping of BMO-10GU. These discontinuities likely resulted from the development of seepage faces as the water level in the well dropped below a succession of relatively thin water bearing zones that presumably supplied most of the water to the well. The presence of these zones was evident at BMO-10GU because the well was screened at a shallow depth near the water table. The shallow construction and low permeability resulted in dewatering of a portion of the screened interval during the test, a necessary precondition for the development of seepage faces.

The thin water-bearing zones in the bedrock likely have higher conductivities due to fracturing, which would also imply relatively low effective porosities. Under these conditions, the rate of sulfate transport in these zones could be similar to the rate of transport in basin fill even though the rate of mass transport in bedrock may be substantially smaller because the average transmissivity of the bedrock is small compared to the basin fill.

In addition, background water level monitoring in the basin fill in the vicinity of BMO-4B indicated that variations in water level of a few tenths of a foot to more than 1 foot (that are only partially related to changes in barometric pressure) can occur in this area. Water level fluctuations in BMO-4B, screened from 500-600 ft bls, correlate poorly with water level fluctuations in NWC-03 CAP, screened only to a depth of 160 feet. The poor correlation indicates that changes in hydraulic head within the basin fill in this area can vary significantly with depth. These results imply that the permeability and the potential rate of sulfate transport within the basin fill may vary significantly with depth.

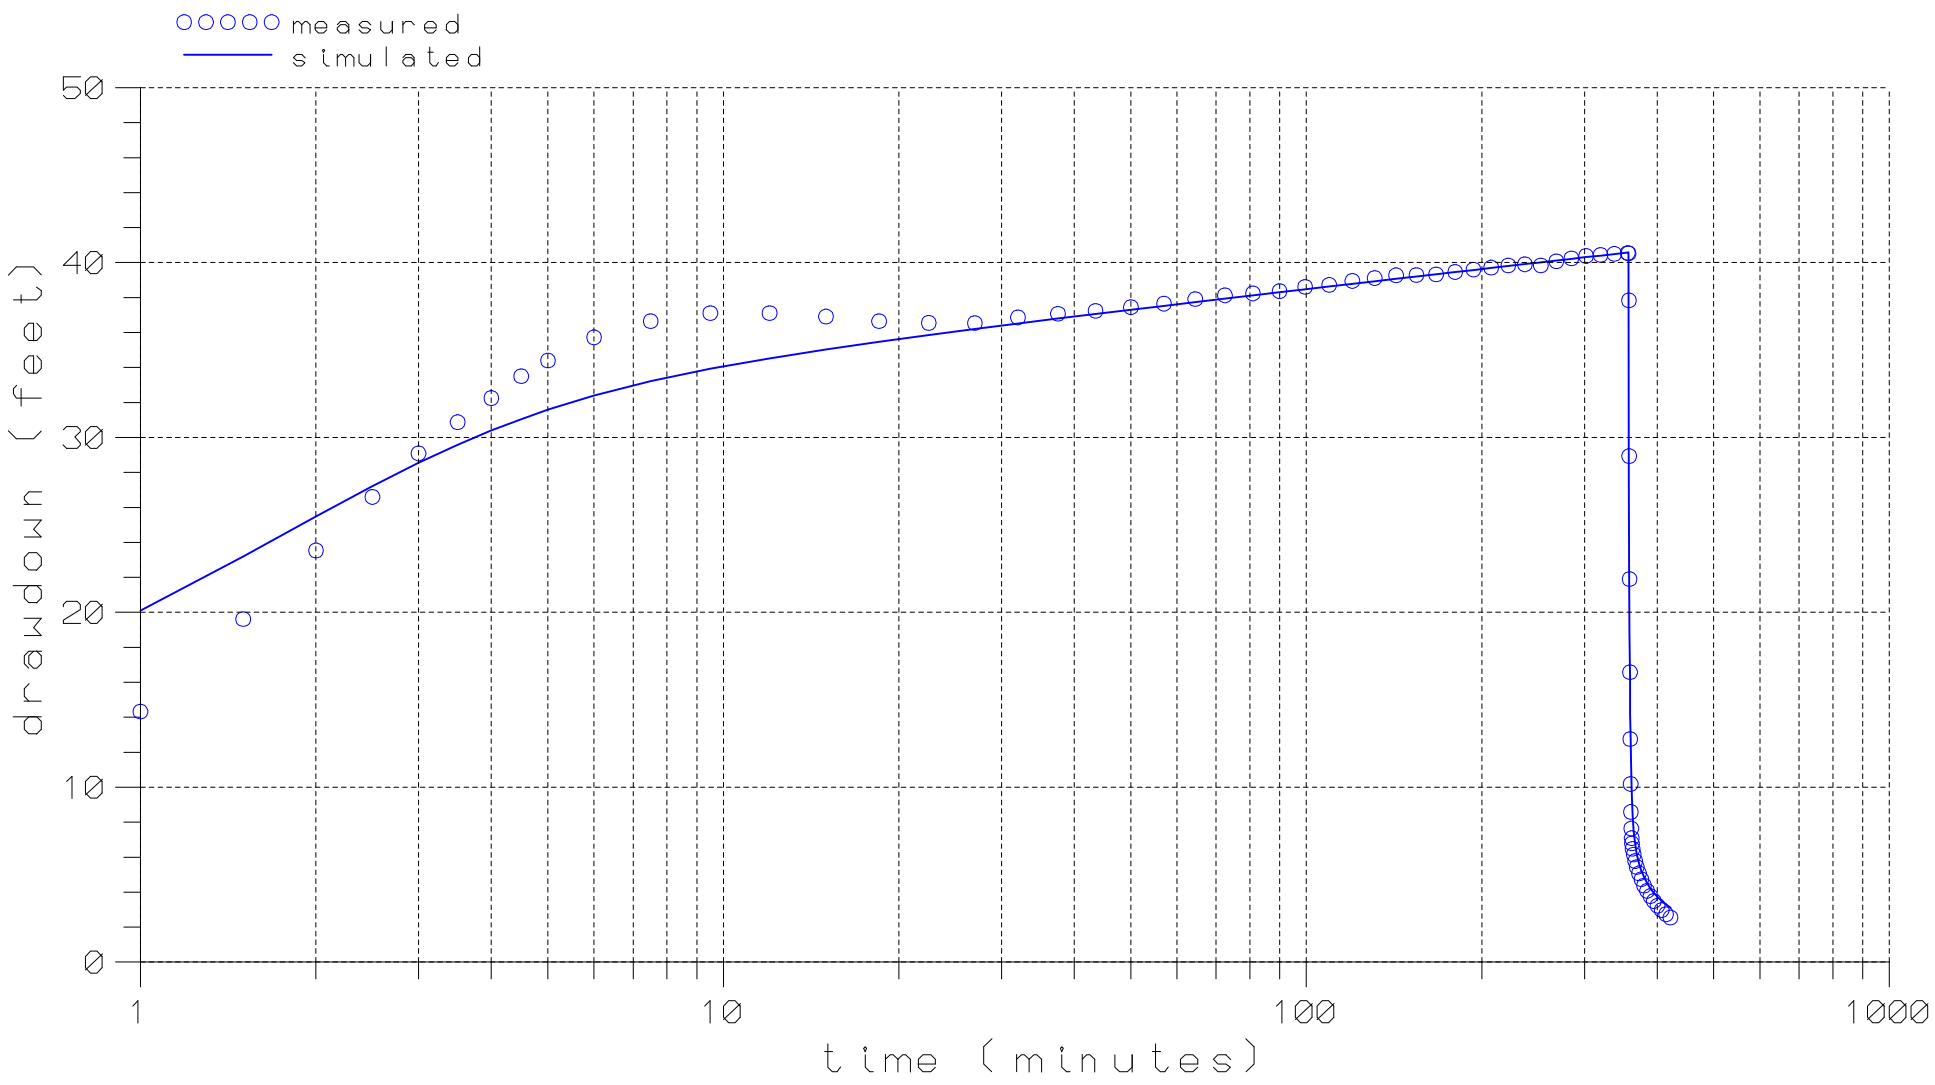
effective well radius/casing radius = 1.13 / 0.455 ft

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT BMO-13M DURING PUMPING AT APPROXIMATELY 1.75 AND 3.75 GPM
(homogeneous aquifer solution)

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ BMO-13M/whip/bmo13mf.srf	**N.52**



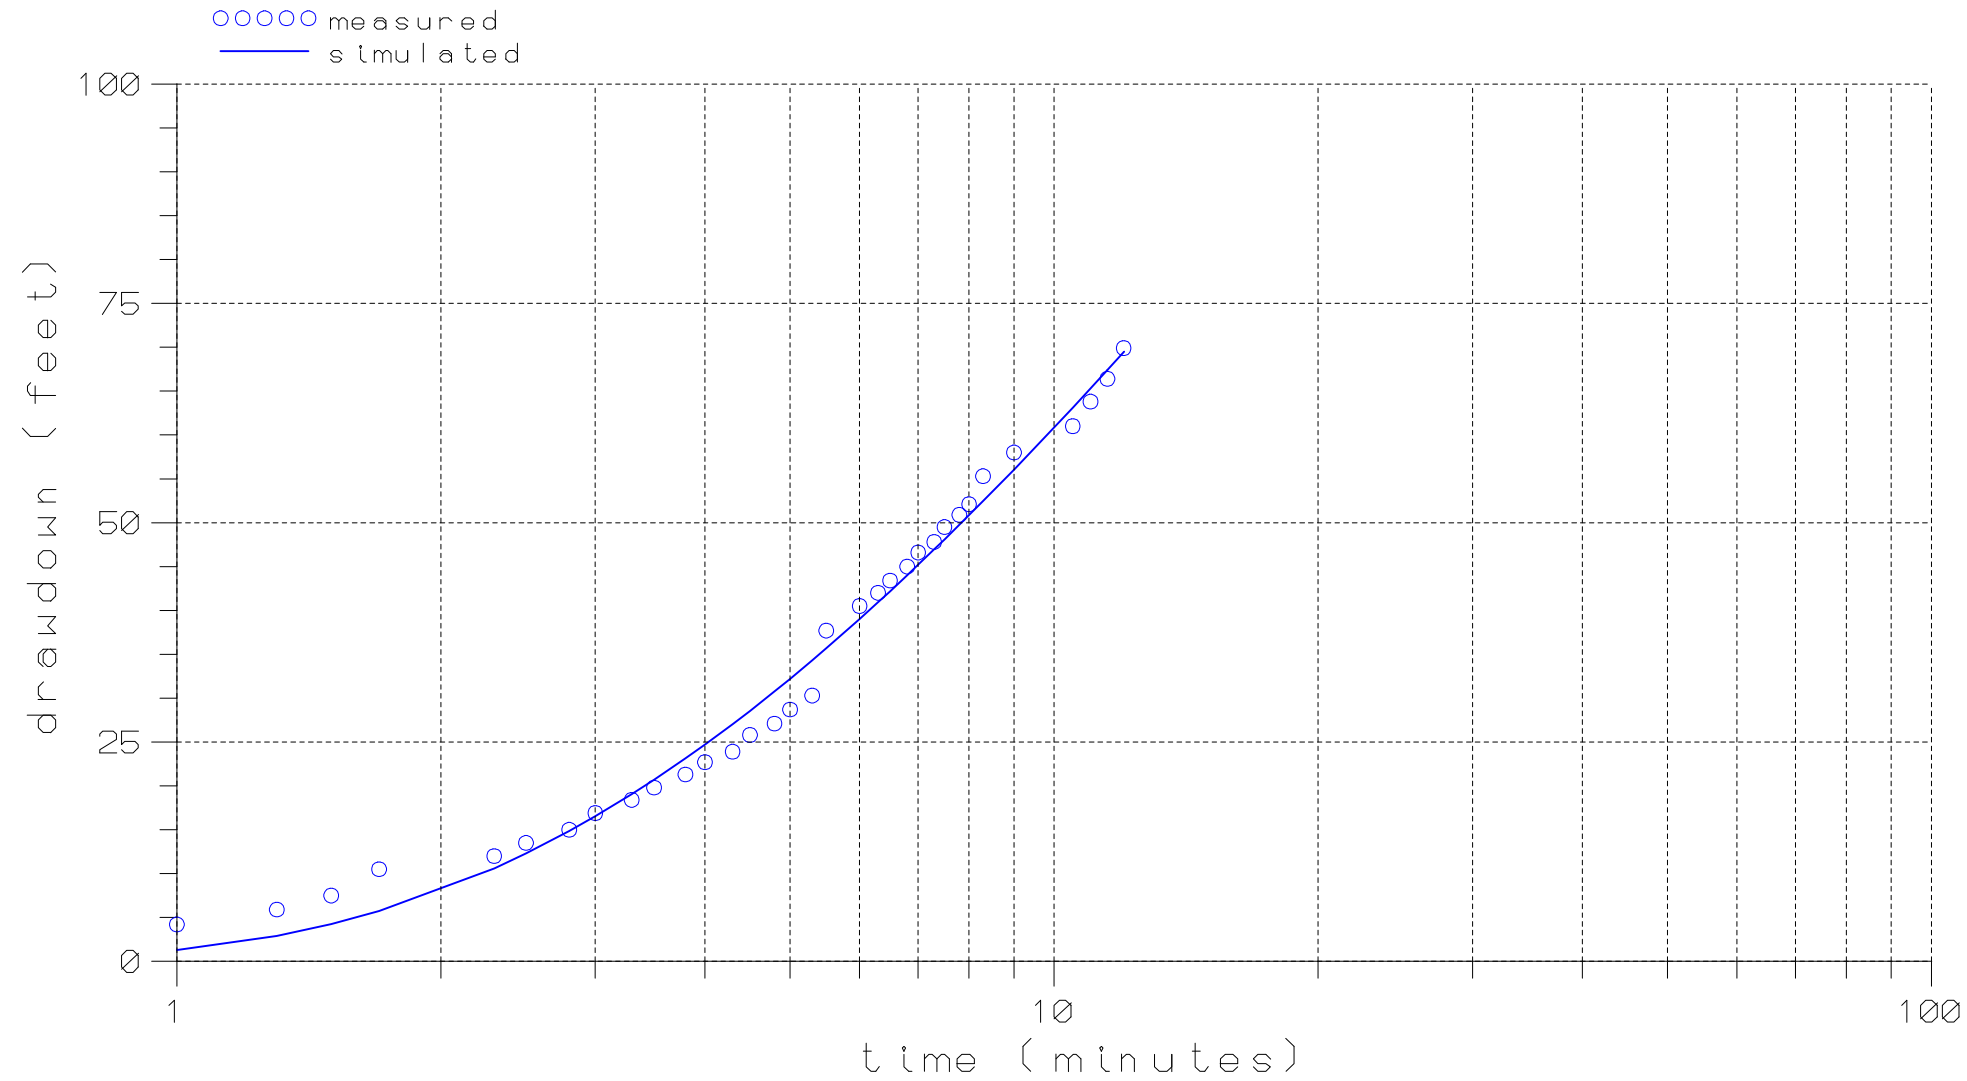
RESULTS

Transmissivity = 142 ft2/day
Storage coefficient = 1e-5
Vertical Hydraulic Conductivity = NA
well loss constant = 0.044
well loss exponent = 2
assumed aquifer thickness = 120 ft

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT GARNER WELL DURING PUMPING AT APPROXIMATELY 15 GPM

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ GARNER/whip/garner.srf	**N.53**



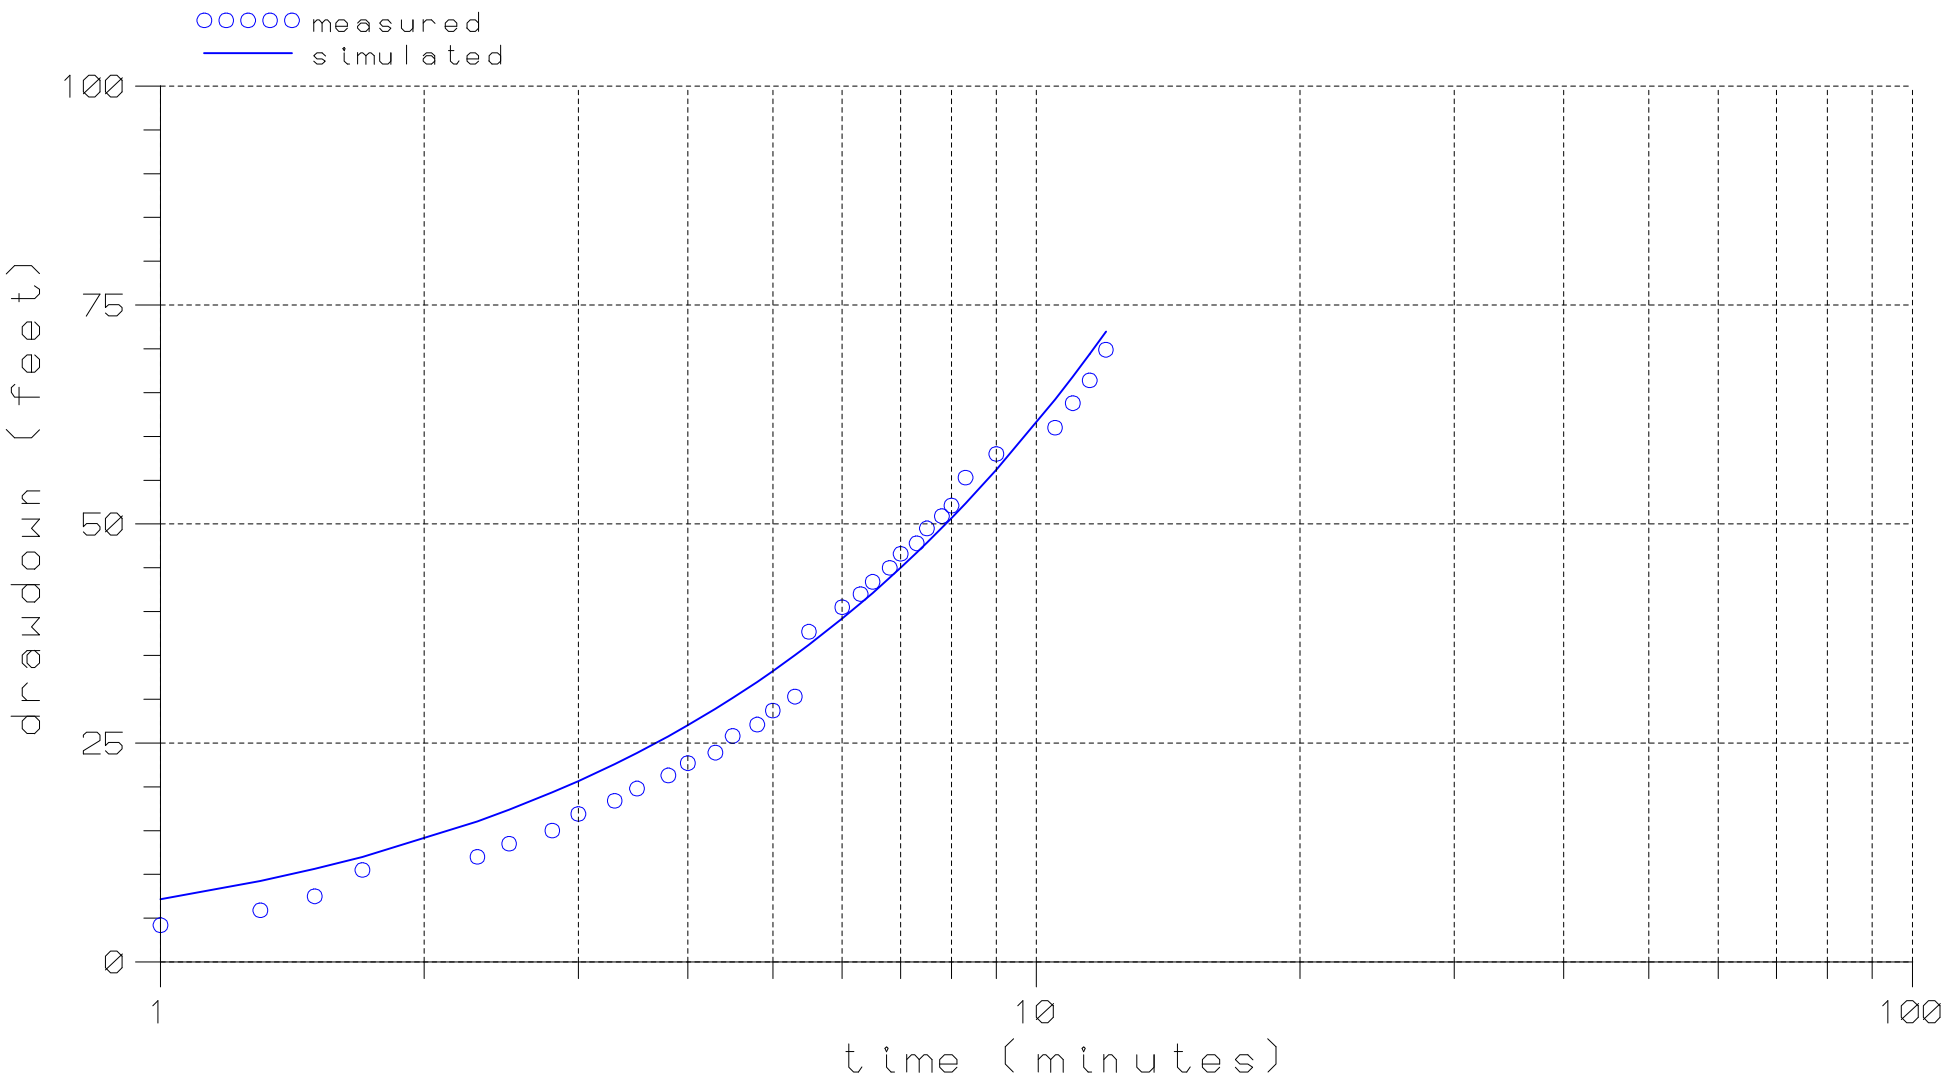
RESULTS

Transmissivity = 15.7 ft2/day
Storage coefficient = 0.041
Vertical Hydraulic Conductivity = 0
well loss constant = NA
well loss exponent = NA
assumed aquifer thickness = 346 ft
effective well radius/casing radius = 1.66 / 0.225

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT TM-02A DURING PUMPING AT APPROXIMATELY 9 GPM

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ TM-02A/whip/tm02a.srf	**N.54**



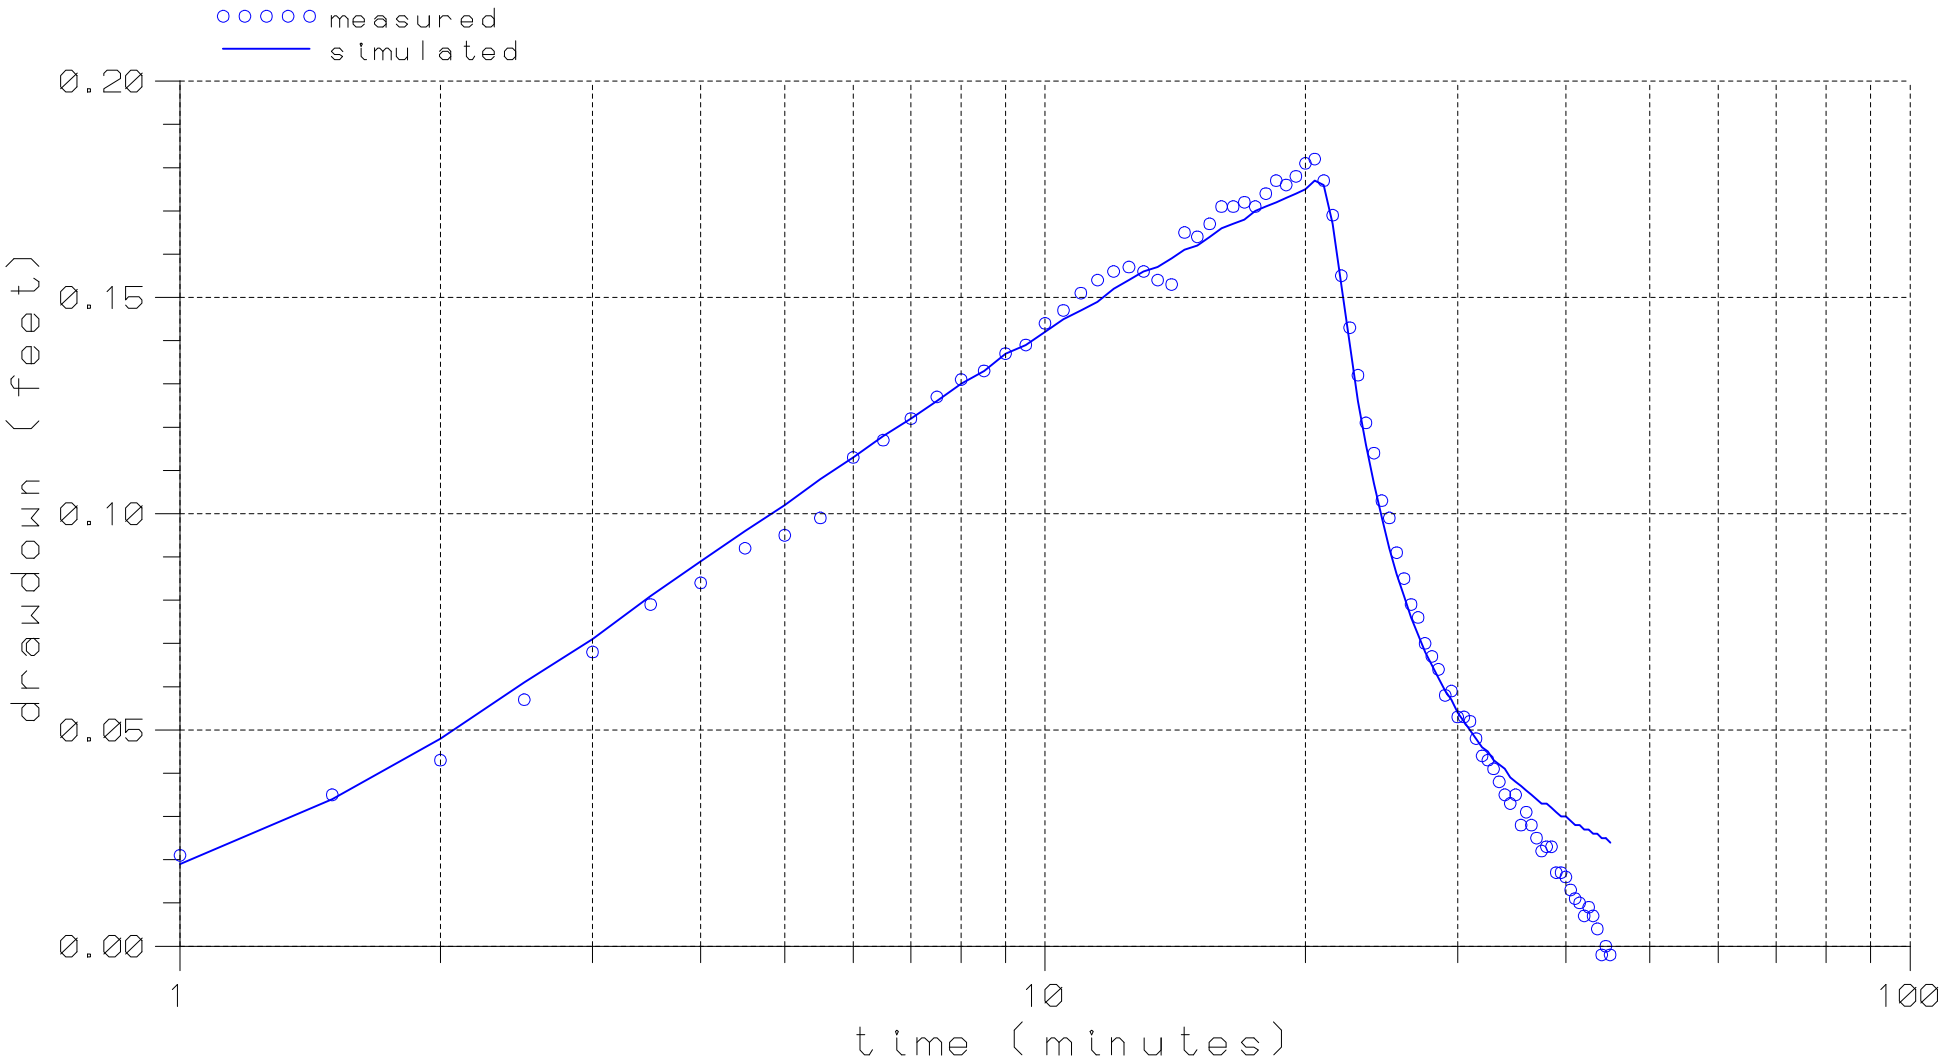
RESULTS

Transmissivity = 2.0 ft2/day
Storage coefficient = 2e-4
Vertical Hydraulic Conductivity = NA
well loss constant = NA
well loss exponent = NA
assumed aquifer thickness = 100 ft
effective well radius/casing radius = 2.36 / 0.259

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT TM-02A DURING PUMPING AT APPROXIMATELY 9 GPM
(homogeneous aquifer solution)

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ TM-02A/whip/tm02afp.srf	**N.55**



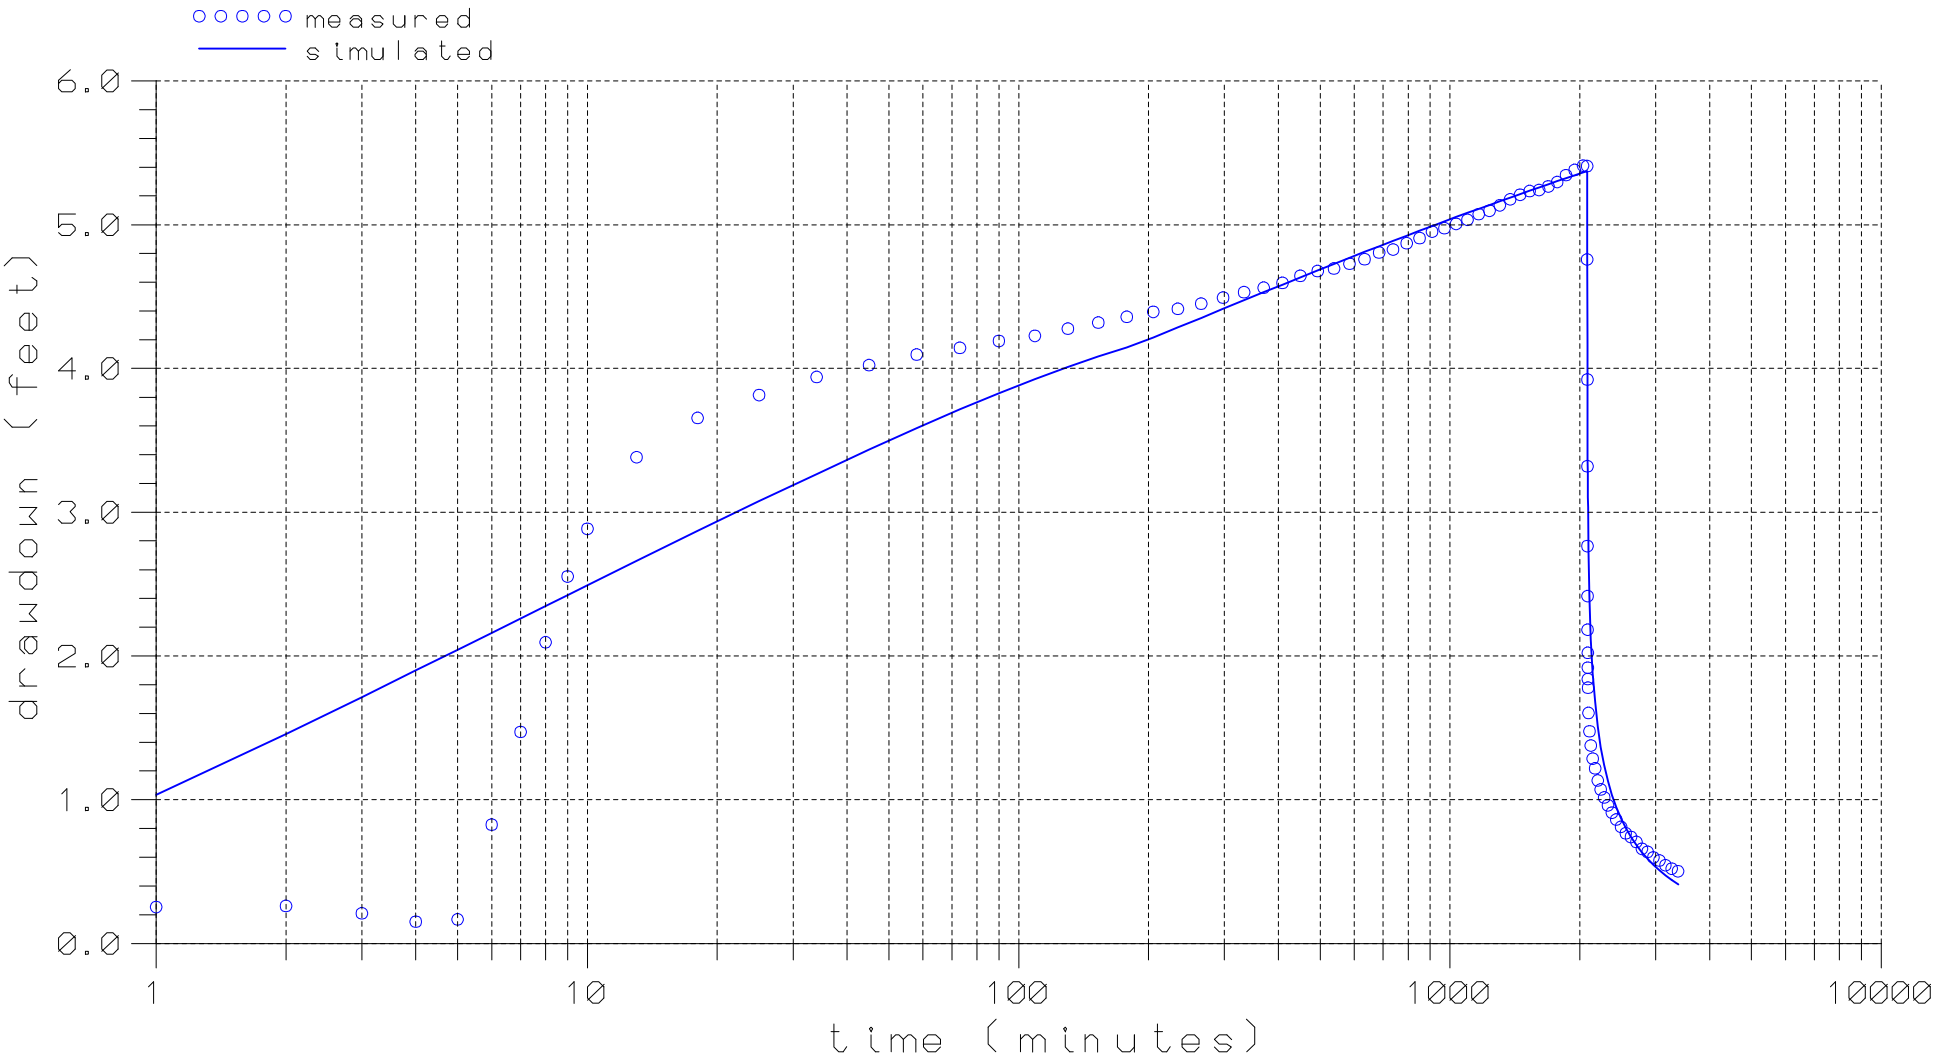
RESULTS
(linear trend removed)

Transmissivity = 21,000 ft2/day
Storage coefficient = 4.53e-4
Vertical Hydraulic Conductivity = 3.45 ft/day
well loss constant = NA
well loss exponent = NA
ssumed aquifer thickness = 505 ft

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT NWC-3 CAP DURING PUMPING OF NWC-3 AT APPROXIMATELY 52 GPM (DATA CORRECTED FOR ATMOSPHERIC PRESSURE CHANGE AND A LINEAR TREND)

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/29/09	H:/872000/Task 2.4/ NWC-3/2008test/whip/nwc3ob.srf	**N.56**



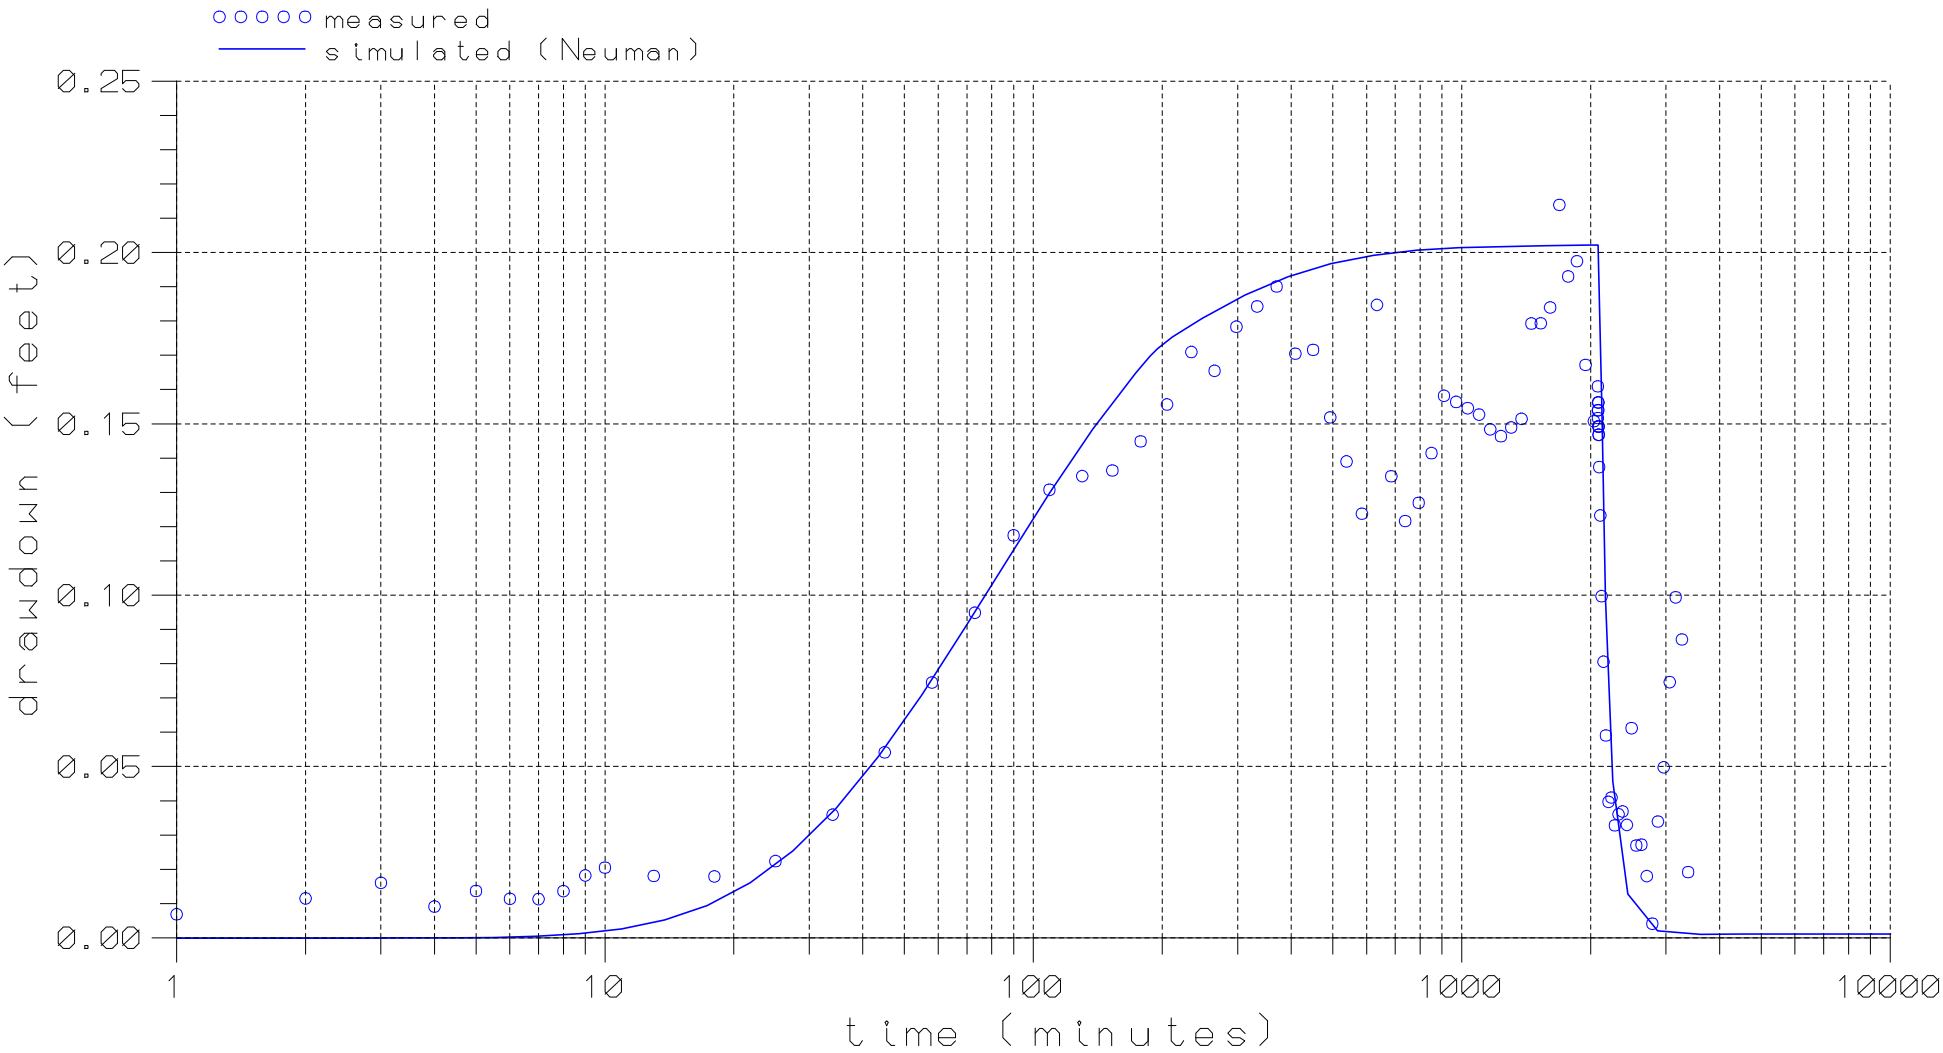
RESULTS
(linear trend removed)

Transmissivity = 24,000 ft2/day
Storage coefficient = 0.0694
Vertical Hydraulic Conductivity = 1 ft/day
well loss constant = NA
well loss exponent = NA
assumed aquifer thickness = 505 ft

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT TVI-713 DURING PUMPING OF TVI-875 AT APPROXIMATELY 380 GPM

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ TVI875/whip/TVI713.srf	**N.57**



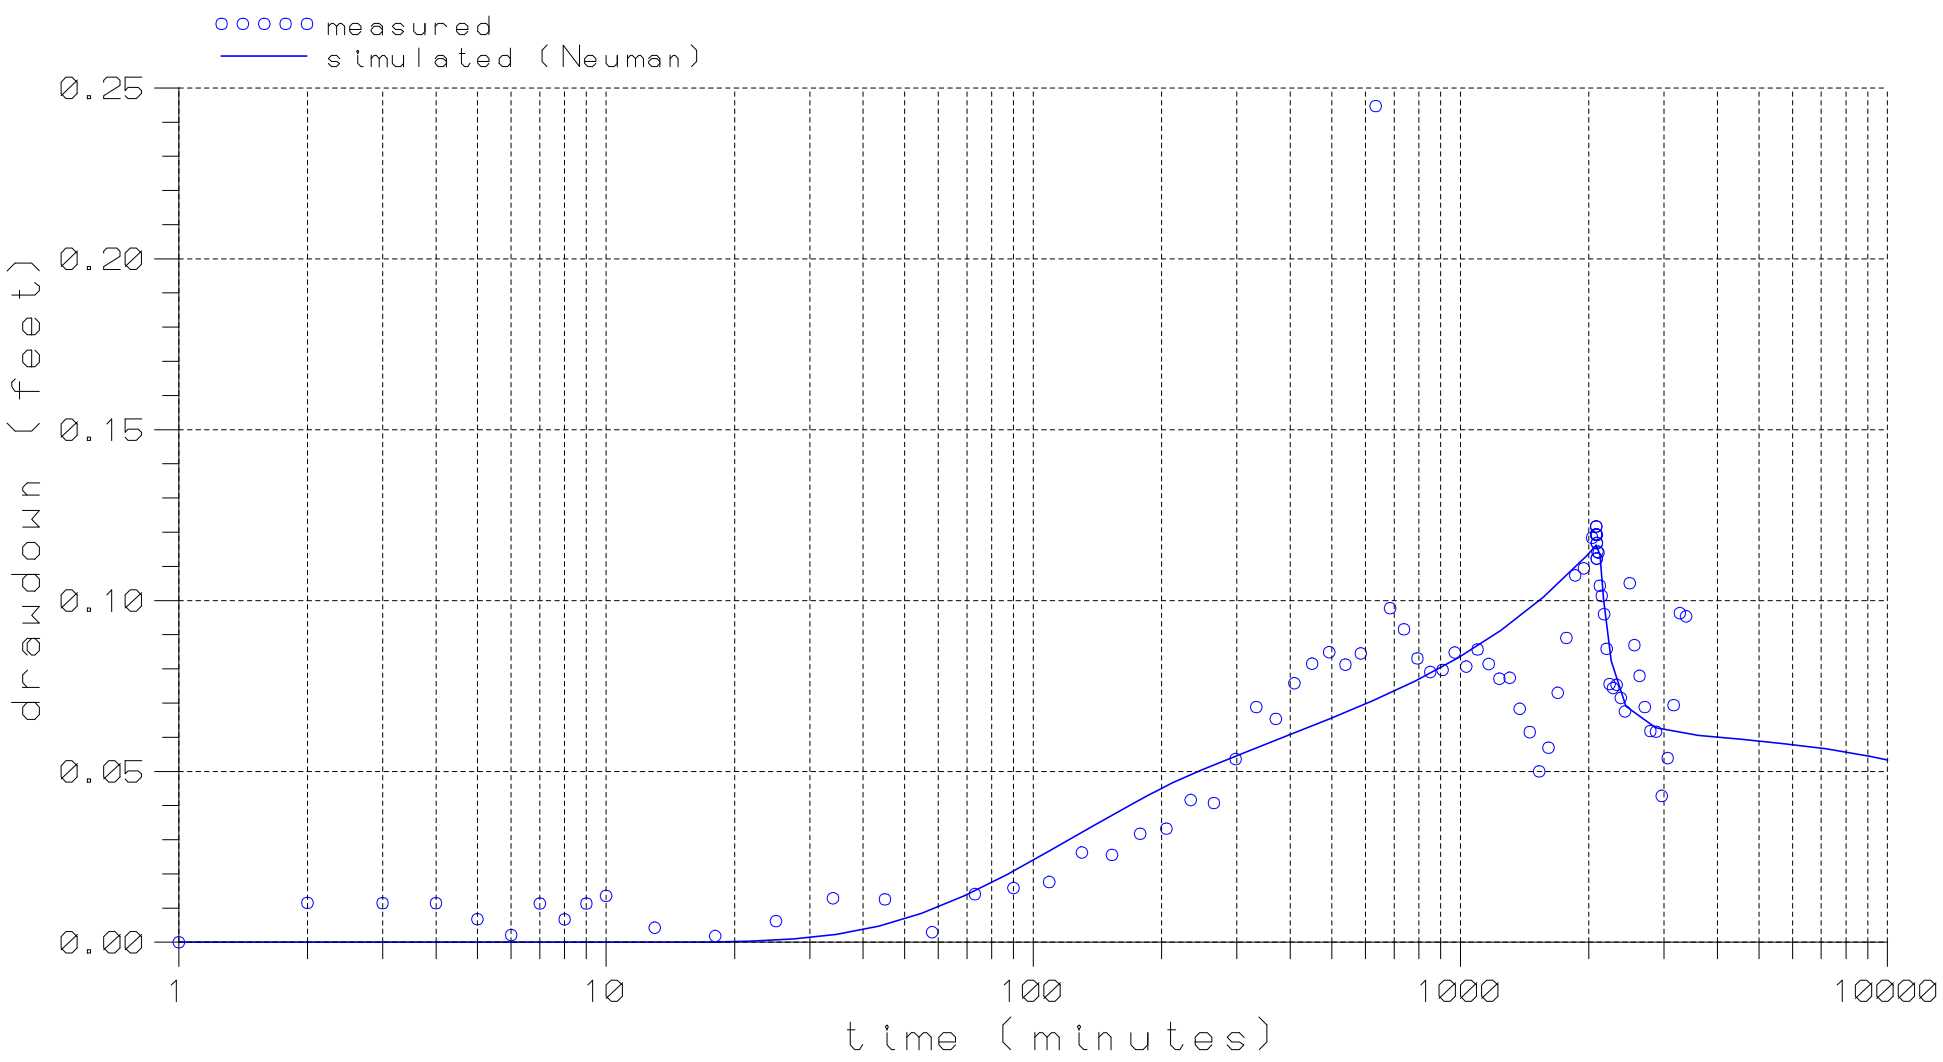
RESULTS
(linear trend removed)

Transmissivity = 28,850 ft2/day
Storage coefficient = 6.85e-6
Specific Yield = 0.012
Beta = 0.0008952 (implies Kz/Kh of 1.5e-4)
assumed aquifer thickness = 505 ft

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT BMO-4B DURING PUMPING OF TVI-875 AT APPROXIMATELY 380 GPM (USING NEUMAN SOLUTION IN AQTESOLVE)

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ TVI875/aqtesolv/bmo4baqt.srf	**N.58**



RESULTS
(linear trend removed)

Transmissivity = 21,860 ft2/day
Storage coefficient = 3.15e-3
Specific Yield = 0.0494
Beta = 0.0826 (implies Kz/Kh of 0.0107)
assumed aquifer thickness = 505 ft

HYDRO GEO CHEM, INC.

MEASURED AND SIMULATED DRAWDOWNS AT NWC-3 DURING PUMPING OF TVI-875 AT APPROXIMATELY 380 GPM (USING NEUMAN SOLUTION IN AQTESOLVE)

APPROVED	DATE	REFERENCE	FIGURE
SJS	4/25/09	H:/872000/Task 2.4/ TVI875/aqtesolv/nwc3aqt.srf	N.59

APPENDIX N.2

HAND MEASURED WATER LEVELS
2008 AQUIFER TESTING

TABLE N.2.1
Manual Sounder Measurements
BMO-2008-1G Aquifer Test

Date	Time	DTW (ft btoc)	Meter (gpm)	Pail (gpm)	Meter Reading	Notes

TABLE N.2.4
Manual Sounder Measurements
BMO-2008-5B Aquifer Test

Pump test at Well BMO-2008-5B, 9-30-08

All depth measurements are to the top of the casing before cut down — TOS corr 1.01 — DTW Corr 144.20

Top of casing is 1.01' above the well pad - on the north side

24.81 feet in between wells

Test started at 8:00:00 — flow rate

Observation Well BMO-2008-5M

TABLE N.2.5
Manual Sounder Measurements
BMO-2008-5M Aquifer Test

Pump test at Well BM Pump was set at 360 ft bls, well screen 340-440, total well depth 450

All depth measurements are to the top of the sounding tube — TOS corr 0.30, DTW Corr 146.24

Top of sounding tube is 0.30' above the top of the casing

Test started at 7:47:00, Step 2 at 8:48, 3 at 9:48 flow rate — Observation well is 23 feet from the pump well

Manual sounder — Observation Well BMO-2008-5B

TABLE N.2.11
Manual Sounder Measurements
BMO-2008-9M Aquifer Test

Pump test at Well BMO-2008-9M, 08-08-08

All depth measurements are to the top of the sounding tube — TOS corr 0.20 — DTW Corr 287.82

Top of Sounding tube is ~.2 feet above the top of casing

Test started at 9:15; however for the first 30 seconds, Edgar was trying to set the flow rate as he had shut the valve the night before and forgot it, so the pumping really did not start until 20 seconds or more into the test.

Time (hr:mn:sc)	DTW (ft)	Elapsed Time (min)	drawdown (ft)	flow rate bucket (gpm)

TABLE N.2.13
Manual Sounder Measurements
BMO-2008-10GU Aquifer Test

Pump test at Well BMO-2008-10GU, 08-04-08

All depth measurements are to the top of the sounding tube — TOS corr 1.15 — DTW Corr 299.28

Top of Sounding tube is 1.15 feet above the top of casing

Test started at 9:41 — flow rate

TABLE N.2.15
Manual Sounder Measurements
BMO-2008-13B Aquifer Test

Pump test at Well BMO-200813B, 10-3-08
All depth measurements are to the top of the uncut casing
Test started at 7:55:00, 2nd step at 8:55, 3rd step at 9:55.
Pump at 420 ft, troll at ~ 250ft.
WDC started drilling on 13M at ~7:06:30
A small increase was seen followed by a drop in head by about 0.37 ft
Flow rate from the drilling was ~38 gpm at 11:30, and ~43 gpm at 17:00.
Hole was cased to 240 ft. Basin fill was 520 feet,
limestone (Mural formation?) to at least 610'

				flow rate

APPENDIX N.3

EXCERPTS FROM WHIP MANUAL

SECTION 1 : INTRODUCTION, METHODOLOGY AND FEATURES OF WHIP

1.1 : INTRODUCTION

WHIP is a sophisticated Well Hydraulics Interpretation Program designed to operate on a personal computer. The program is designed to assist in the analysis, design and interpretation of aquifer tests, and offers capabilities far exceeding those of other currently available hydrologic well test programs. WHIP can be used to simulate and analyze aquifer tests involving complex pumping histories and pumping well conditions, boundary conditions, and includes the unique capability of performing simultaneous analyses of drawdown responses in multiple observation wells, influenced by multiple pumping wells.

WHIP provides the ability to simulate, analyze and design both drawdown and recovery tests for the following pumping well and aquifer conditions :

Constant Pumping Rate and Ideal Homogenous Aquifer

Variable Pumping Rate History for up to 10 Pump Wells

Wellbore Storage in the Pumped Well

Well Skin and Non-Linear Losses in the Pumped Well

Partial Penetration of both Pumped and Observation Wells

Observations in up to 10 Observation Wells

Vertically Anisotropic Aquifers

Leaky Confining Beds with and without Storage

Double-Porosity Aquifers

Recharge and No-Flow Boundaries including determination of Location and Orientation

Pump Tests, Recovery Tests, Slug or Bailer Tests, and Step Drawdown Tests

The automatic parameter estimation capabilities of WHIP are intended to be an aid to the knowledgeable user and not as a substitute for professional judgement. Please use them in that sense. We know of no automated procedure that can surpass the capabilities of an experienced hydrogeologist or engineer in interpretating well hydraulics information.

1.2 : METHODOLOGY

Aquifer test analysis involves three fundamental tasks : diagnostic analysis (selection of an appropriate model of the aquifer–well system), determination of aquifer properties, and evaluation of uncertainties in the model and parameter estimates. WHIP enables you to perform these tasks in the following manner.

1.2 1 : DIAGNOSTIC ANALYSIS

The diagnostic features of WHIP permit you to inspect and pre–analyze the data in order to identify structural aspects of the aquifer which may affect drawdown behavior. Diagnostic analysis initially involves comparison of the observed drawdown to the drawdown predictd by the Theis solution for an ideal homogenous aquifer. The manner in which the observed data deviate from the Theis solution may then be used to select structural aspects of the aquifer that may influence the test results, such as double–porosity flow, confining bed leakage, and boundary effects.

The diagnostic procedures use semilog drawdown (Jacob–Cooper) analyses and Theis recovery analyses to obtain preliminary estimates of transmissivity and storage coefficient. Theis curves are generated using these values and are graphically compared to the observed data. Individual data points can be eliminated from the analysis and the data "windowed" so that you have complete control over that portion of the test from which transmissivity and storage coefficient are computed.

In addition to the standard linear, semilog and loglog plots, you can observe the effects of various time transformations on the data as well as first and second derivatives of the drawdowns. The derivatives are especially helpful in determining which portion of the test is displaying Theis behavior. Recovery data may be plotted against normalized recovery time (t/t').

1.2.2 : DETERMINATION OF AQUIFER PROPERTIES

After initial diagnostic analysis and selection of appropriate aquifer model and well conditions, WHIP can be used to generate solutions for both the drawdown and recovery phases of the aquifer test, while taking into account a wide variety of complex aquifer and well conditions. The solutions are generated by numerical inversion of published Laplace Transform domain solutions by Lai and Su (1974), Mavor and Cinco (1979), Serra, Reynolds and Raghavan (1983), Moench (1984), and Moench and Ogata (1984). The solutions are modified to account for time variable pumping as discussed by Gupta and Walter (1985). The inversion of the Laplace Transform domain solution is accomplished using the Stehfest (1970) algorithm. This approach produces rapid and accurate solutions for complex well test conditions where solutions in the real domain are numerically difficult to evaluate. The power of this approach has been discussed by Moench and Ogata (1984). The approach also permits rapid incorporation of new solutions into WHIP as they become available in the literature. Note that WHIP solutions are not based on numerical tabulations of type curves, or on grid type numerical techniques.

The values of aquifer and well parameters for particular test conditions can be estimated using a combination of "manual trial and error", and "automatic" curve fitting techniques. The automatic parameter estimation techniques in WHIP are not intended to provide "black-box" interpretations or to diminish the need for professional judgement in aquifer test analysis. Rather, they provide a rapid means for obtaining "best-fit" parameter values for user specified conditions. You have complete control of those portions of the test from which parameters are to be estimated. You select which parameters are to be estimated and which are to be user specified.

Graphical output to the screen allows easy comparison of drawdowns simulated using the latest parameter estimates and the observed data. The program can be instructed to remember and plot simulated drawdowns from a previous set of parameter estimates so that the improvement or deterioration in the test analysis can be seen. Single character activation permits computation or plotting to be aborted or halted by the user without crashing the program.

You are given optional control over fitting criteria and may obtain sensitivity analyses and error estimates. You may opt to use an ordinary least squares or a log least squares fitting criterion. Parameter estimates may be obtained by simultaneously fitting to data from more than one observation or pumped well. Data for each well may be individually windowed to exclude outliers or data that do not conform to the selected model. Each well may be individually weighted based on confidence in the quality of the data from that well, or to force closer fitting to data from chosen wells. On conclusion of an automatic parameter estimation search, WHIP provides function values for each of the fitted wells in addition to the overall function value.

1.2.3 : EVALUATION OF UNCERTAINTY

You may obtain a parameter sensitivity analysis based on a quadratic approximation of the function response surface in the neighborhood of the final automatically estimated parameters. The sensitivity analysis estimates 95% confidence intervals for each parameter and the degree of correlation between each pair of estimated parameters.

1.3 : SOME FEATURES OF WHIP

1.3.1 : INTERPRETATION OF COMPLEX TESTS

The greatest value of the automatic parameter estimation techniques is their ability to interpret complex tests in ways not attainable by conventional curve-matching. WHIP is able to interpret tests affected by highly variable pumping rates, influenced by as many as ten pumping wells, and by linear no-flow or recharge boundaries. Any or all aquifer parameters may be estimated (data permitting), as well as the location and orientation of boundaries. Pumping well properties such as wellbore storage effects, skin and non-linear well-efficiency losses can also be determined. In cases where drawdown is not too large a fraction of the aquifer thickness, the confined aquifer solutions can be modified by the Dupuit correction to simulate water table conditions.

1.3.2 : SIMULTANEOUS ANALYSIS OF MANY OBSERVATION WELLS

A special feature of the code is its ability to fit parameter estimates to the drawdowns observed in several observation wells (including the pumped well). By comparing parameter estimates obtained for individual wells to those determined simultaneously for several wells, you can evaluate the degree of lateral heterogeneity of the aquifer. This feature is also invaluable for interpretations using complex aquifer models which contain too many parameters to be uniquely determined by analyzing the responses in individual wells.

1.3.3 : TIME VARIABLE PUMP RATES

One of the most useful features of WHIP is its ability to handle tests with highly variable pumping rates. Complex pumping histories are approximated as piece-wise linear functions and the resulting drawdown in both the pumped and observation wells is computed and analyzed. This feature nearly guarantees that tests affected by pump failures or poor discharge regulation can still be rigorously interpreted and will not need repeating. A specific use of the variable pumping feature is the analysis of step-drawdown tests.

1.3.4 : SLUG, BAILER AND PRESSURE-PULSE TESTS

WHIP also can simulate slug, bailer, and pressure-pulse tests for any of the well conditions and aquifer models for which continuous discharge solutions are available. This is accomplished by treating the slug or pulse as a finite duration impulse, which most practitioners will agree is more accurate and realistic than the usual assumption of an instantaneous source or sink. The test response in either the slugged well or nearby observation wells may be simulated and interpreted.

1.3.5 : INTERACTIVE MENU OPERATION

Program control is provided through sets of self-explanatory menus which permit the user to run WHIP with little or no reference to the manual. The program also performs automatic error checking and input prompting thus preventing the user from proceeding with an analysis before all necessary data have been entered. Menus are provided for specifying well geometries and location, type of aquifer, type of analysis, prior parameter estimates, parameter estimation criteria, and graphical and tabular output. Menu parameters may be saved so that you can leave WHIP at any time and later resume the analysis.

1.3.6 : DATA ENTRY

Entry of test-specific data such as pumping and drawdown histories is through external files. These may be generated using either a simple prompting routine in WHIP or a user supplied text editor. All input is in list directed (free) format so that external data files may be quickly generated.

1.3.7 : GRAPHICAL DISPLAY OF RESULTS

Observed data and simulated results are plotted to the screen. Linear, semilog, and log-log plots can be displayed. You may choose from several symbol types and plot colors. A title may be added to the plot. The y-axis may be ascending or descending. The plot can be scaled and moved on the screen. The data range to be displayed can be controlled. Hardcopy of the screen plots can be generated using either a printer or pen plotter.

1.3.8 : TAKING A BREAK

You can save the current status of your analysis at any time by 'SAVING' the job and exiting the program. Then at a later time you can re-enter WHIP, reload the job, and continue with the analysis. The methodology for doing this is described in section 4.8.

4.5.1i : SET PUMP WELL PARAMETERS

Select option 9. The program will respond with the pump well parameters menu. Pump well parameters must be entered for each pump well. Select the option corresponding to the desired pump well and enter values for all five parameters separated by spaces or commas.

4.5.1j : SET DUPUIT CORRECTION

Select option 10. The program will switch the Dupuit correction option between 'OFF' and 'ON'. If the Dupuit correction is set to 'ON' the program will modify the drawdowns computed under the assumption of confined aquifer to approximate water table conditions. The formula used is :

Hf = AQTHK - DSQRT(AQTHK*AQTHK - 2.0*AQTHK*Hc) for Hc < AQTHK/2

where;

Hf = drawdown corrected to free surface conditions
Hc = drawdown computed assuming confined aquifer
AQTHK = thickness of the aquifer

Note that the correction is based on approximations to the groundwater flow equations that are valid only for small drawdowns (eg. drawdowns less than about 25% of the aquifer thickness; Jacob Bear 1979). The correction is not applied if the change in saturated thickness exceeds 1/2 the aquifer thickness.

4.5.1k : SET PUMP WELL EFFICIENCY CORRECTION

Select option 11. The program will switch the Pump well efficiency correction between 'OFF' and 'ON'. If the correction is set to 'ON' the program will modify the drawdowns in the PUMPED well to account for well efficiency losses related to the discharge rate. Computed drawdown (in the pump well only) is modified using the formula :

$$Hcor(t) = H(t) + PWEC * PRATE(t)^{PWEX}$$

where;

Hcor(t) = drawdown at time t corrected for pump well efficiency
H(t) = uncorrected drawdown at time t
PRATE(t) = discharge rate in well at time t
PWEC = pump well efficiency correction constant
PWEX = pump well efficiency correction exponent

SECTION 5 : WHIP CONCEPTS

This section describes some of the concepts used in WHIP.

5.1 : AQUIFER SOLUTIONS

WHIP uses published equations describing the analytical solutions in the Laplace Transform space to the differential equations representing the response of groundwater flow systems to hydraulic stress tests. The solutions are of the general form

$$H(d,z,p) = Q(z) * I(d,z,p)$$

where :

H() = laplace transform of the drawdown
Q() = laplace transform of the pumping history
I() = laplace transform of the aquifer impulse response function
d = dimensionless distance from the center of the pumped well
p = hydraulic parameters of the system
z = laplace transform variable corresponding to dimensionless time

The impulse response functions are taken from the literature. The pumping rate function is based on a solution developed by Gupta (1985). The drawdowns in the real domain are obtained by numerical laplace inversion using the Stehfest algorithm (1970).

In this description, the following symbols are used :

A = leakage coefficient
b = thickness of aquifer
bc = thickness of confining layer
bm = half thickness of the matrix slab
bs = average thickness of the fracture skin
C = wellbore storage coefficient
D = skin coefficient
Kc = hydraulic conductivity of confining layer
Kf = hydraulic conductivity of the fractures
Km = hydraulic conductivity of the matrix
Ks = hydraulic conductivity of the fracture skin
Kv = vertical hydraulic conductivity of the matrix
K0 = modified bessel function of the first kind of order zero
K1 = modified bessel function of the first kind of order one
Lc = leakance of the confining layer
Pi = 3.14159
r = distance from center of pump well to center of observation well
rc = pumpwell casing radius
rw = pumpwell radius
Rk = matrix-fracture transfer coefficient
Rs = matrix-fracture storativity ratio
S = storativity
Ssc = specific storage of confining layer
Ssf = specific storage of the fracture system
Ssm = specific storage of the matrix system
t = time
T = transmissivity
yp = depth to base of pump well casing
dp = depth to top of pump well casing
yo = depth to base of observation well casing
do = depth to top of observation well casing

5.1.1 : HOMOGENOUS AQUIFER

The homogenous aquifer solution is based on Lai and Su (1974) with a skin factor added. The aquifer is assumed to be homogenous, isotropic, confined, of uniform aquifer properties in space, and of infinite extent. The confining layer may be treated as leaky with no storage. The pump well is assumed to be of finite diameter. By specifying a non-zero pumpwell casing radius the user may investigate the effects of wellbore storage. The pumpwell may also be assumed to have a skin effect.

The impulse response function is given by the equation :

$$I(d,z,p) = Go(d,z) \;/\; [2*Pi*T]$$

where :

$$Go(d,z) = \frac{K0(lm) + D*lm*K1(lm)}{lm*K1(lm) + z*C*[K0(lm)+D*lm*K1(lm)]} \qquad \text{if } d = 1$$

$$= \frac{K0(d*lm)}{lm*K1(lm) + z*C*[K0(lm)+D*lm*K1(lm)]} \qquad \text{if } d > 1$$

$$lm = sqrt[\; z + A \;]$$

$$d = r/rw$$

$$A = rw/sqrt(\; T/Lc)$$

$$C = [rc/rw]*[rc/rw]/[2*S]$$

$$z = \text{laplace inverse of } (\; [t*T]/[S*rw*rw] \;)$$

Note that in the presence of wellbore skin, the solution inside the pumpwell will differ discontinuously from the solution immediately outside the pump well.

5.1.3 : VERTICALLY ANISOTROPIC, LEAKY AQUIFER WITH PARTIAL PENETRATION

The vertically anisotropic aquifer solution is based on Moench and Ogata (1984). The aquifer is assumed to be homogenous, isotropic, confined, of uniform aquifer properties in space, and of infinite extent. Anisotropy is considered between the vertical and horizontal directions. The wells are assumed to be partially penetrating LINE elements so that wellbore storage and skin effects are neglected. The confining layer may be treated as leaky. Movement of water in the leaky confining layer is considered to be vertical. The solution accounts for storage in the confining layer.

The impulse response function is given by the equation :

$$I(d,z,p) = G1(d,z) \;/\; [2*i*T]$$

where :

$$G1(d,z) = K0(lm1) + P$$

$$lm1 = sqrt(neta*neta+lm1dum)$$
$$lm1dum = 4.0*neta*beta*Coth(4.0*neta*beta/[rovB*rovB])$$
$$neta = r*sqrt(z*S/T)$$
$$beta = r*sqrt([Kc*Ssc]/[T*b])/4.0$$
$$rovB = r*sqrt(Kc/[T*bc])$$

$$P = 2.0*Sum/[[xpy-xpd]*[xoy-xod]]$$

$$Sum = \sum_{n=1}^{infinity} Dif1(n)*Dif2(n)*K0(lm2)$$

$$Dif1(n) = Sin(n*xpy)-Sin(n*xpd)$$
$$Dif2(n) = Sin(n*xoy)-Sin(n*xod)$$
$$lm2 = sqrt(lm1*lm1+lm2dum)$$
$$lm2dum = [Kv*b/T]*[[n*Pi*r/b]*[n*Pi*r/b]]$$

$$xpd = Pi*dp/b$$
$$xoy = Pi*yo/b$$
$$xod = Pi*do/b$$
$$z = laplace\ \ inverse\ of\ t$$

5.1.4 : WATER TABLE CONDITIONS

WHIP allows you to analyze tests in water table aquifers by use of the Dupuit correction (see section 4). This method involves computing the confined aquifer solution first and then applying a correction according to the Dupuit formula. The method can be applied to any of the aquifer types and test conditions available in WHIP. Note that the correction is based on approximations to the groundwater flow equations that are valid only for small drawdowns (eg. drawdowns less than 25% of the aquifer thickness, Bear 1979).

5.2 : WELL LOCATION GEOMETRY

WHIP permits you to analyze data from tests where several pump wells are pumping simultaneously, and drawdowns are observed in several observation wells (including the pumped wells). The locations of the various wells must be specified using a standard cartesian (x,y) coordinate system. For convenience, you may choose to place the origin of the coordinate system at one of the pump wells. This system for specifying well geometry is illustrated below.

Note that if drawdown data are observed in one of the pumped wells, you still have two data files in the pumping well – one for the pumping rate history and one for the observed drawdown data. While entering the well location geometry you then tell WHIP that the two data files refer to one and the same well by specifying identical coordinate values for the two in the 'set up well geometry' menu.

Consider the example in Figure 5.1. This example depicts a well field being pumped at two locations P1 and P2. Drawdowns are observed at three locations O1, O2 and O3. Note that observation point O1 is at the pump well P2 (ie. drawdowns are observed in the pumped well). Hence we will have two pump history data files and three drawdown data files. Also the well field geometry will be specified to WHIP as follows;

Well	X-coordinate	Y-coordinate
Obs well O1	100.0	-50.0
Obs well O2	75.0	75.0
Obs well O3	-75.0	50.0
Pump well P1	0.0	0.0
Pump well P2	100.0	-50.0

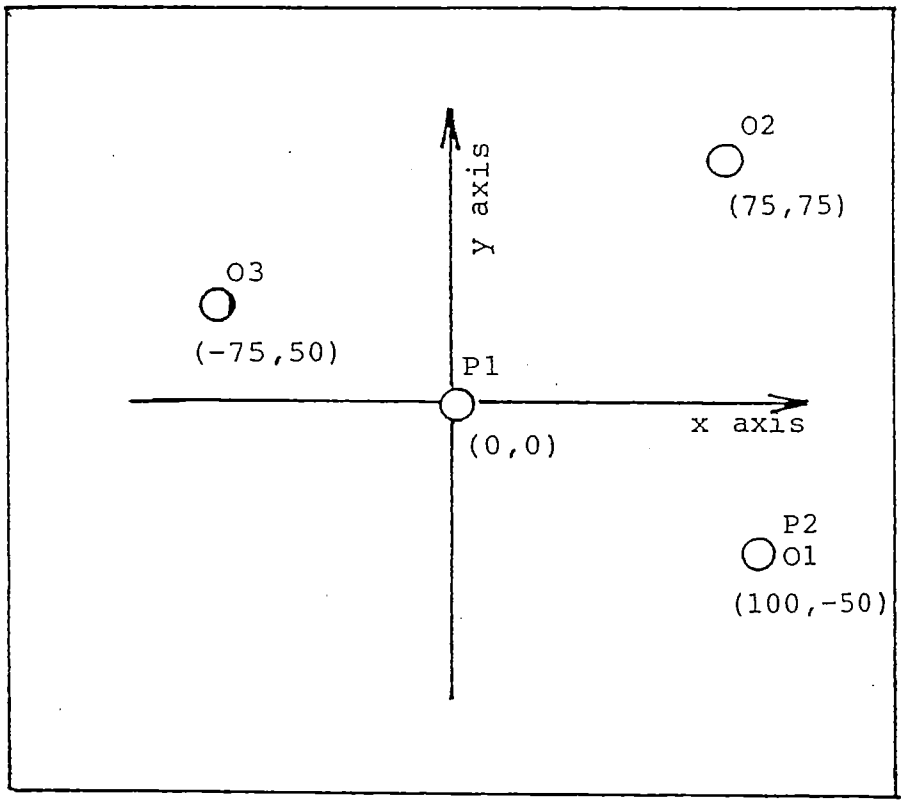

Figure 5.1 : Well location geometry example with two pump well locations and three observation well locations

5.3 : TIME VARIABLE PUMPING HISTORIES

In classical well test analyses, the assumption is usually made that the pumping rate was approximately constant during the test. This assumption is frequently violated in practice, and the resulting drawdown data can often be difficult to analyze. One of the powerful features of WHIP is its ability to simulate both pumped and observation well response to variable pumping rates. This feature nearly guarantees that pump failures and pumping fluctuations will not compromise the test; the test data can still be rigorously interpreted. An example of WHIP's ability to handle severe pumping rate fluctuations is shown in figures 5.2 and 5.3.

WHIP handles time varying pumping rates by approximating the pumping history by a piecewise linear function (see figure 5.2). You enter as data the known values of pumping rate at various times, and WHIP assumes that the pump rate varies linearly between those times.

Although WHIP enables a complex pumping history to be represented to as great a degree of accuracy as desired, this feature should be used with care. As you increase the number of data points at which pump rate is specified, the computation required to compute the solution grows correspondingly. In practice you should include only the major features of the pumping history in your data file (at least in the early stages of the analysis).

Please note that WHIP assumes the pump shuts off at the last time specified in the pumping history file, and automatically switches into recovery mode at that time. Hence it is not necessary to set the value of the pumping rate to zero at the end of the test. In fact, doing so may cause numerical problems to surface during computation.

Also, although step drawdown can be handled using the variable pumping rate feature, a better approach is discussed in section 5.7

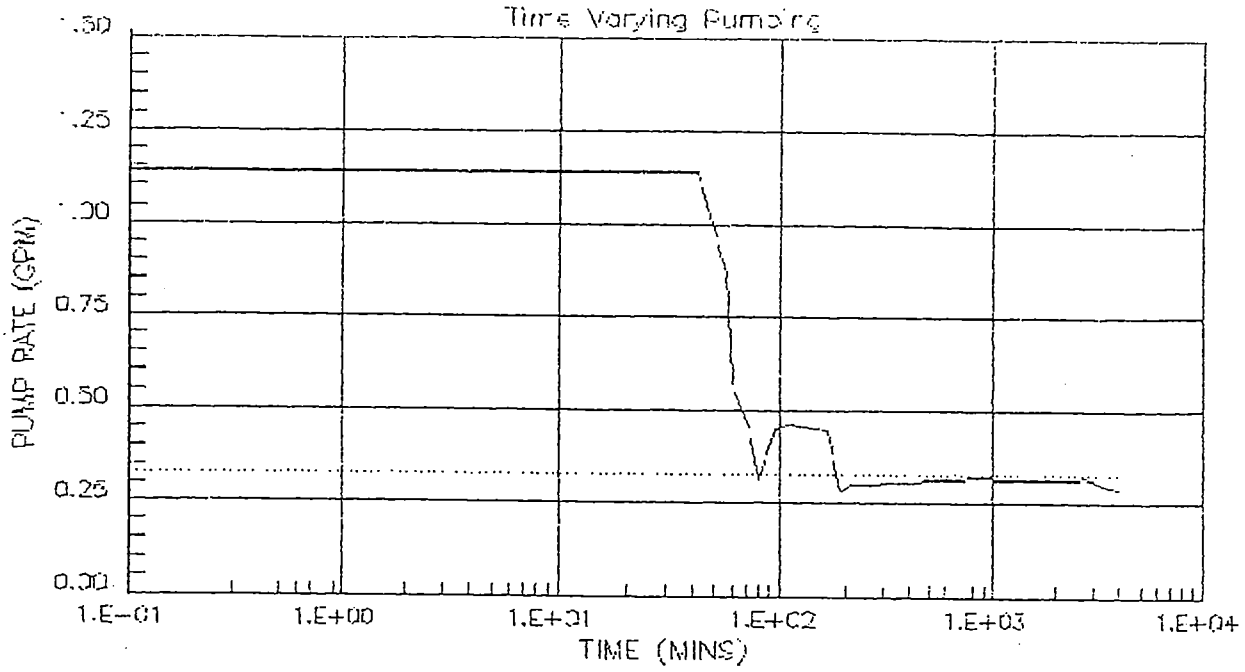

Figure 5.2. Time varying pumping rate

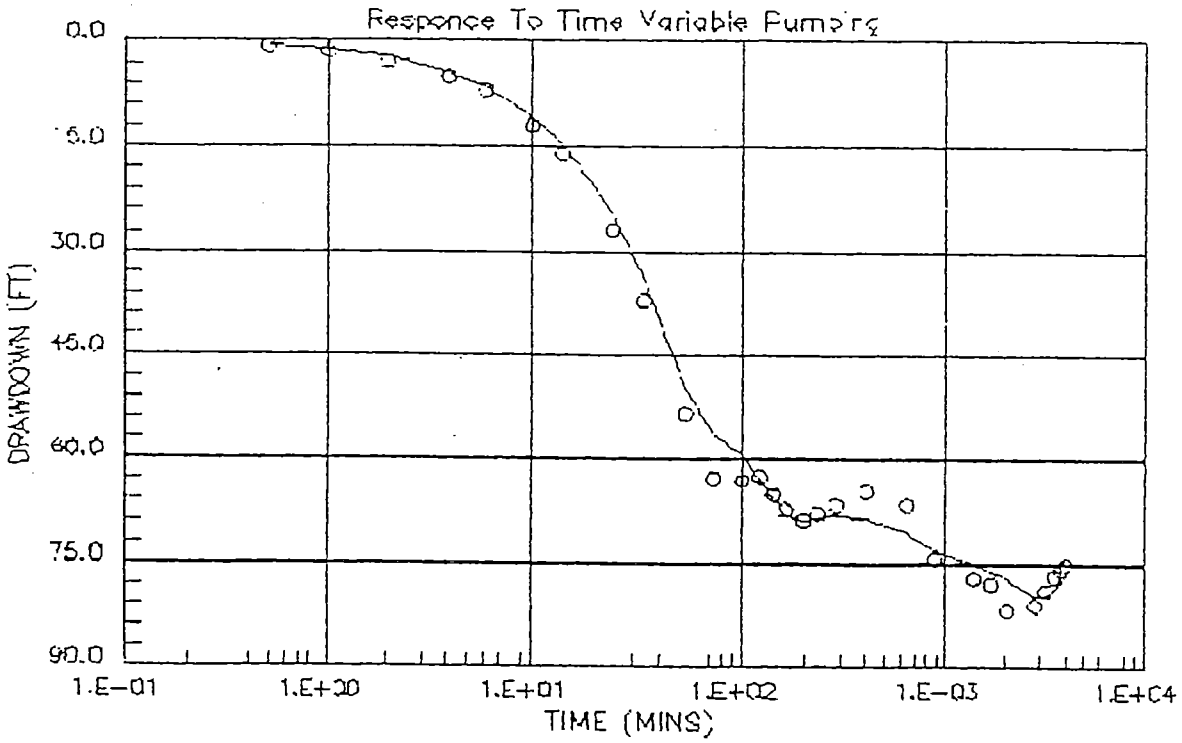

Figure 5.3. Response to time varying pumping

5.4 : MULTIPLE PUMPING WELLS

WHIP enables you to interpret the response in an observation well which has been influenced by two or more wells pumping simultaneously. This can be especially useful if a well test must be conducted in an area influenced by other wells that are being pumped and which you have no control over. Another advantage is that you do not have to wait for the system to return to equilibrium due to a well test in one location before begining a test in another location. A third possibility is that you may be able to design a more complex pumping test that provides information about the formation not available by standard means. By combining the multiple pumping well feature with the ability to represent time varying pumping histories, and the ability to analyze drawdowns in several wells simultaneously, you have almost limitless freedom in innovative test design.

Section 5.7 discusses the use of the multiple pumping well feature in the analysis of step drawdown tests.

5.5 : MULTIPLE OBSERVATION WELLS

WHIP enables you to simultaneously interpret the response in several observation wells (including the pumped wells) that are influenced by the same pumping history. Hence, if you have several observation wells, you can obtain a single set of parameters that best represent the formation characteristics (assuming horizontal isotropy), instead of analyzing each pumped-observation well pair individually and then averaging the results. Of course, you can also analyze each pair individually and compare the results to the combined analysis. This enables you to judge if horizontal anisotropy is significant or not.

The ability to analyze multiple observation wells simultaneously is also invaluable for aquifer models containing too many parameters to be uniquely determined by analyzing individual wells. Examples of such parameters are confining bed properties affecting leaky aquifer response and matrix hydraulic properties in fractured (double porosity) media.

5.6 : SLUG, BAILER AND PRESSURE PULSE TESTS

Slug, bailer and pressure pulse tests all involve the sudden addition or withdrawal of a known volume of water to or from the aquifer. Slug and bailer tests are usually performed in an open well by physically adding or removing a known volume of water, or by causing a sudden change in the water level using a displacement tube. Pressure pulse tests are performed by displacing a known volume of fluid in a packed-off section of a well (Bredehoeft and Papadopulos 1980).

Traditional methods for analysing such tests involve matching the data to analytical solutions based on the assumption that the slug or pulse occurs instantaneously (Cooper et al 1967, Bredehoeft and Papadopulos 1980). The analysis is further limited by the fact that published type curves are only available for the response in the well being tested, even though a response can sometimes be measured in nearby observation wells (Walter and Thompson, 1982). In practice, instantaneous removal or displacement of fluid cannot be achieved, so the stress applied to the formation has a finite duration. WHIP assumes that the stress is applied over a finite duration, and permits analysis of the response in observation wells.

WHIP can be used to analyse such tests in either of two ways as described below. For simplicity of the description we shall refer specifically to slug tests.

a) The simplest way is to select the slug/bailer option in the 'enter data for new job' menu (see section 4). WHIP then queries the user for the volume of water added or removed from the well (gallons), the time at which you began to slug the well (mins), and the duration over which the slug was applied (secs). WHIP uses this information to automatically generate a square wave pumping history, by dividing the volume by the duration. The test can then be analysed using any of the aquifer models or features included in WHIP. Note in particular that you must include the effects of a finite diameter well by specifying a non-zero casing and well radius. The bailer test is treated in an identical manner. In the case of the pressure pulse test, the volume refers to the volume of water displaced from the packed off interval into the formation.

b) The second way is to treat the test as a variable pumping rate test. You compute the equivalent pumping rate and then create a data file as discussed in section 4. This approach permits you to design and analyze 'repeated pulse' tests (Walter and Thompson 1982).

As a convenience for the user, WHIP always treats response to slug/bailer tests as positive values. When WHIP reads the data files for a slug/bailer test, the signs of the water levels are adjusted to produce a positive response and the sign of the slug/bail volume is changed accordingly. It is assumed that all of the observed drawdowns in the well will be positive or negative. While reading in the data files WHIP will warn the user if positive and negative values are found in a data set for a test identified as a slug test.

Many times a well will be stressed with a displacement tube; first dropping the tube into the well (positive slug volume), monitoring the response, and then withdrawing the tube (negative slug volume) and monitoring the response. In this case positive and negative drawdowns will be observed. There are two methods for handling the data in WHIP. First, the test can be treated as two separate tests, one a slug test and the other as a bailer test with separate data files. Second, the test could be treated as a variable rate pumping test. In this case a pump history file is set up with the slug volume and duration expressed as an equivalent pumping rate and duration (negative discharge => injection) and the bailed portion of the test expressed as a positive equivalent pumping rate.

*** SPECIAL NOTE FOR PRESSURE PULSE TESTS ***

In simulating or analyzing a pressure pulse test, the value used for the effective radius of the well casing 'rc' should be adjusted using the following equation (Bredehoeft and Papadopulos 1980):

$$rc = rc*\mathrm{sqrt}[b*cw*dw]$$

where

b = length of the test zone (packed-off interval) in feet
cw = compressibility of the test zone (includes water, casing and packers) in ft2/lb
dw = density of water in lb/ft3

*** SPECIAL NOTE NON ANALYSIS OF SLUG TESTS ***

The data collected during a slug test are heavily influenced by well bore storage effects. When analyzing a slug test using the method presented by Lohman, the data are fitted to curves with different values of α, where

$$\alpha = \frac{r_s^2 S}{r_c^2}$$

and r_s = radius of well screen or open hole, r_c = radius of the well casing, and S = the storage coefficient. In WHIP r_s is referred to as the pump well radius and r_c is referred to as the casing effective radius (see Section 4).

Typically the casing radius (r_c) is well defined. Unfortunately, the same is not true of the well radius (r_s). As a consequence, WHIP's estimates of storage cannot be any more accurate than the accuracy of the values r_c and r_s. When analyzing a single slugged or pumped well, the well radius should be thought of as the shortest distance from the center of the casing to the drawdown observation that is representative of the formation. If the well is properly constructed and developed, this will generally be the radius of the borehole.

Additionally, drawdown becomes less sensitive to storage as storage

decreases. The effect of this can be seen from the type curves used to analyze slug test data by curve matching. The type curves draw closer together as S decreases.

Figure 5.4 shows a family of curves generated using the results of example 4 in Section 3. However, the value of storage is changed a full order of magnitude from the previous curve. As storage decreases the sensitivity of drawdown to a change in storage decreases. Because of the lack of sensitivity it is important to have a "good" initial estimate of transmissivity when analyzing slug test data.

For most slug tests, an approximate initial estimate of transmissivity can be obtained by performing a recovery analysis of drawdown versus t/t' using the diagnostic features of WHIP. In this case, WHIP performs the recovery analysis using an average pumping rate, Qa, computed from the volume of the slug divided by the user specified slug duration. The window used to perform the recovery analysis should include only the late time data ($t/t' < 1.1$). The value of transmissivity computed in this way will tend to be greater than the true value, but will provide a good initial estimate for formal analysis of the test using automatic parameter estimation. The basis for this procedure is described below.

The estimate of T from recovery analysis is determined from the slope of the recovery curve, which is

$$\frac{d_s}{d\ln(t/t')} = \frac{Q_a}{4\pi T} = \frac{d_s}{d\ln}\left(1+\frac{t_p}{t_r}\right) \qquad (1)$$

where t_p is the slug (pumping) duration and t_r is the recovery time.

Noting that

$$\ln(1+t_p/t_r) \rightarrow t_p/t_r$$

as t_p/t_r goes to zero (late time), (1) can be written as

$$\frac{Q_a}{4\pi T} \simeq \frac{d_s}{d(t_p/t_r)} \qquad (2)$$

In the case of a slug test in a line source well, the late time slug response is

$$s \propto \frac{Q_a t_p}{4\pi T t_r} \qquad (3)$$

and the user can verify that the derivative of drawdown with respect to t_p/t_r (3) is identical to (2), s, that the recovery analysis will yield a reasonable initial estimate of transmissivity.

If we use the methodology described above to get an initial

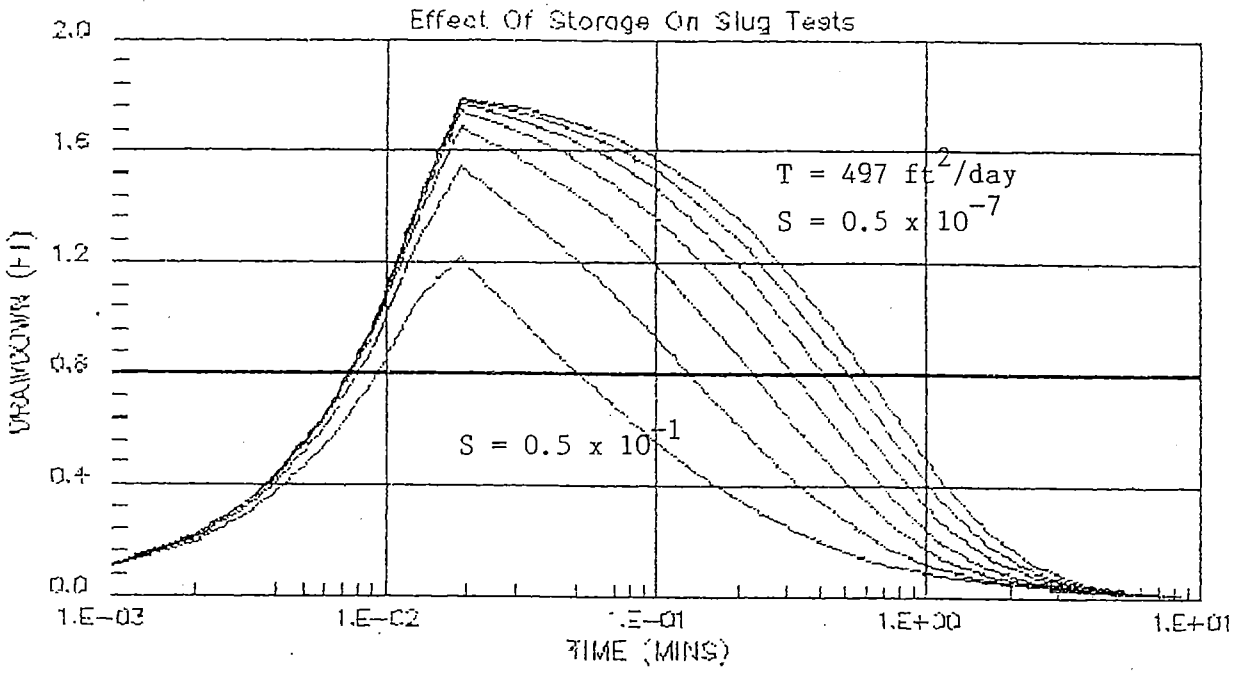

Figure 5.4. Simulated drawdown using the results from Example 4, Section 3. T = 497 and storage is varied from 0.5×10^{-1} to 0.5×10^{-7}. Each curve represents a full order of magnitude change in storage

transmissivity estimate, and perform the first estimation on storage alone. WHIP should solve the problem correctly.

The user should still make a comparison between the computed result and the observations to verify the correctness of the solutions (see example 4, Section 3).

5.7 : STEP DRAWDOWN TESTS

A step drawdown test is one in which the pumping rate is held constant for a period of time, while the drawdown response is observed, then the pumping rate is quickly changed to a new value and held constant again while the new response is observed. Several such step changes in pumping rate may be included in a single test.

There are two ways in which WHIP can be used to analyse the data from a step drawdown test. The first is to represent the step changes as very rapid changes in pumping rate in a variable pumping rate history file. In practice, if the time in which the change is assumed to occur is made very small, numerical problems may occur in the laplace inversion methodology.

The recommended approach is as follows. Assume that at time 0.0 minutes the pump is switched on at Q1 gpm and the pump rate is held constant till time T1 when the rate is changed to Q2. The test is ended at time T2 (see figure 5.5). Create two pumping files. In pump file number 1 assume a constant pumping rate of Q1 gpm from time 0.0 mins to time T2 minutes (the end of the test). In pump file number 2 assume a constant pumping rate of Q2-Q1 gpm from time T1 minutes to time T2 minutes. The form of the pumping files is illustrated below. Then treat the problem as though there are two pumping wells, but that both the pumping wells are located at the same x and y coordinates.

```
PUMP HISTORY FILE 1 FOR STEP DRAWDOWN TEST
0.0      Q1
T2       Q1

PUMP HISTORY FILE 2 FOR STEP DRAWDOWN TEST
T1       Q2-Q1
T2       Q2-Q1
```

In addition WHIP permits you to investigate the well efficiency effects for the pumping well. These effects are easily estimated using step drawdown tests. See section 4 for a discussion of this feature.

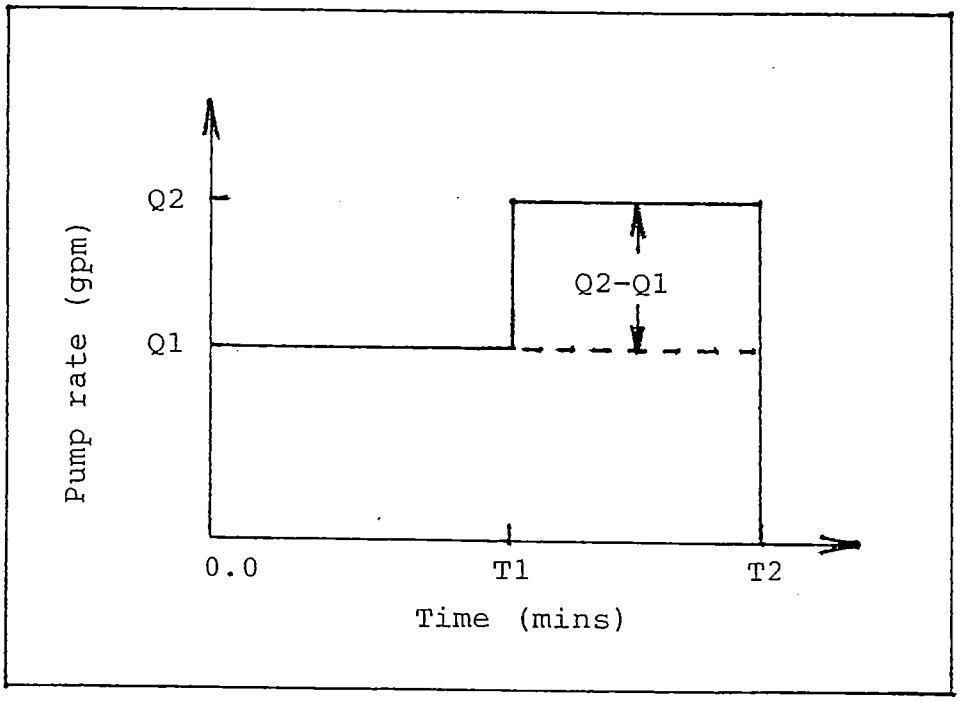

Figure 5.5 : Example of pumping rate variation for a step drawdown test

5.8 : BOUNDARIES

WHIP uses the principle of superposition of image wells to compute the influence of a specified boundary on the drawdowns in the pumped or interference wells. At present, only one linear boundary of either no-flow or recharge type is supported by WHIP.

The boundary can be at any location and at any orientation; its position is specified by the perpendicular distance of the boundary line to the origin of the coordinate system, and by the counter clockwise angle in degrees from the x-axis direction to the same perpendicular line (see figure 5.6).

Please note that for the solution to be accurate, the wellfield must lie completely on the origin side of the boundary line. If an observation well is placed on the other side of the boundary, the results will not be correct. WHIP does NOT check to ensure that the wells are correctly placed with respect to the boundary, so a little care is necessary when analyzing multiple wells.

When computing the boundary influenced drawdowns, WHIP allows you to simultaneously view the drawdown that would result if no boundary was present (see section 4).

If you have two or more observation wells, with adequate data, you can estimate the location (distance and orientation) of the boundary using the automatic parameter estimation feature of WHIP.

Solution time is approximately doubled when the boundary option is being used.

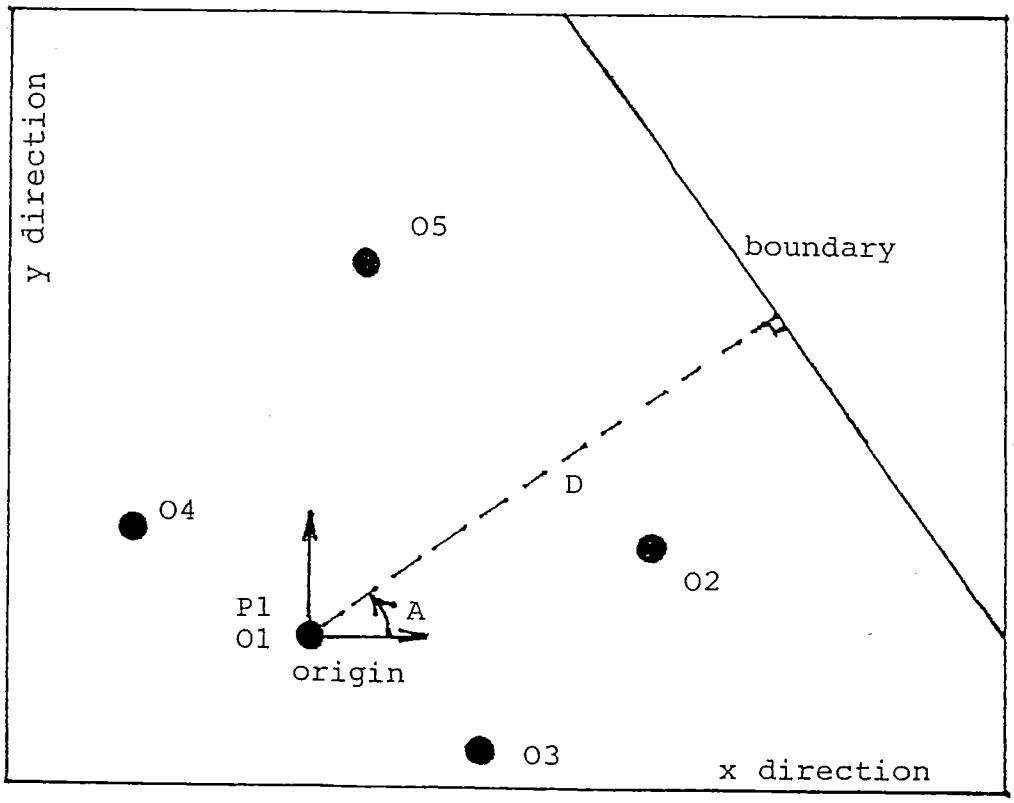

Figure 5.6 : Illustration of a five observation well field (O1-O5) with a boundary at distance D and orientation A form the origin

5.9 : SIMULATING DRAWDOWNS IN THE PUMPED WELLS

If the drawdown data you have is from the pumped well itself, the procedure for analysis is identical to the case when the data is observed in an observation well. Create a pumping history data file and an observed drawdowns data file. Treat the observed data as though it were from an inteference well, but give the inteference well the same x and y coordinates as the pumped well to which the data belongs. WHIP automatically recognises that the data is from the pumped well and modifies the computed solution to reflect wellbore storage, skin, non-linear losses and so on, as necessary.

5.11 : AUTOMATIC PARAMETER ESTIMATION

Automatic parameter estimation in WHIP is accomplished by minimizing either the SLS or the LSLS criterion (see section 4) with respect to the hydraulic parameters of choice. In the case of slug or bailer test analyses, the observed drawdowns Ho and the computed drawdowns Hc in the SLS or LSLS criterion equations are replaced by their normalised values Ho/Max(Ho) and Hc/Max(Hc) respectively.

The chosen criterion is minimized with respect to the parameters by use of the Levenberg-Marquardt version of the Newton type non-linear iterative optimization algorithm (Gupta 1983).

Although in theory all parameters of interest could be optimized simultaneously, in practice it is desirable to optimize only a few parameters (say 1 to 4) at a time. This is because the data often does not contain sufficient information of appropriate quality to enable the algorithm to distinguish between several different combinations of the values of the parameters (the parameters are highly correlated).

The recommended approach is to use the diagnostics procedures first to get ballpark estimates for transmissivity and storativity and to use prior information or interactive trial and error parameter fitting to get reasonable initial estimates of the other relevant parameters. Then the automatic method can be used on two to three parameters at a time to refine the parameter estimates.

If you are interested in learning about the concepts underlying automatic parameter estimation, we recommend that you read Bard (1974) or any other text on non-linear optimization.

1. HYDRAULIC TESTING

This section describes the performance, results, and analysis of hydraulic tests conducted at the BMO-2010, TM-16, and TM-42 groundwater monitoring wells and the private well FLEMING. Hydraulic testing at the BMO-2010-1M, BMO-2010-2M, TM-16, TM-42, and FLEMING was conducted as part of the Focused Bedrock Investigation (Copper Queen Branch, 2010c). Hydraulic testing at BMO-2010-3B and BMO-20103M was conducted under Task 2.4 of the Work Plan to Characterize and Mitigate Sulfate in Drinking Water Supplies in the Vicinity of the Concentrator Tailing Storage Area (Work Plan) (Hydro Geo Chem, Inc., 2008a). Locations of the tested wells are shown in Figures 8 and 10 of the main text. Construction details for the BMO-2010 wells are summarized in Table 13 of the main text and a detailed description of each BMO-2010 well is provided in the well installation section of the report (Section 3.4). Geologic logs for the BMO-2010 wells are in Appendix J. Construction information for the TM-16, TM-42, and FLEMING wells is summarized in Table 5 of the main text and Arizona Department of Water Resources (ADWR) records for TM-16, TM-42, and FLEMING are contained in Appendix D.

The purpose of the hydraulic testing was to evaluate aquifer hydraulic properties, including transmissivity, hydraulic conductivity, and storage coefficient in the area of each well. Hydraulic testing was conducted using the procedures described in the Work Plan. Hydraulic testing was conducted at each of the four new BMO-2010 wells as an initial characterization of hydraulic properties. Existing wells TM-16, TM-42, and FLEMING were also selected for hydraulic testing to characterize bedrock hydraulic properties east of the Black Gap Fault. Near the end of testing at each well, a groundwater sample was collected for sulfate analysis. The

analytical results of the testing of water samples from these wells are included in Table 11 of the main text.

1.1 Hydraulic Test Procedures

Testing procedures were conducted using the same methodology used for testing of the BMO-2008 wells, as described in Appendix N.1. Hydraulic tests consisted of step-rate pumping of the well, measuring the pumping rates, and measuring the water levels in the pumping well and nearby observation wells (where available) before, during and after pumping. Constant rate pumping was performed where step-rate pumping was not practical. Observation wells consisted of other BMO-2010 wells or existing nearby wells. Typically the observation wells were screened at different depth intervals than the pumping well, and possibly in a different hydrologic unit. For example, during pumping of BMO-2010-3M, which is screened in the Cintura Formation, BMO-2010-3B was used as an observation well. BMO-2010-3B is screened in the overlying basin fill. Table N.4-1 summarizes the pumping wells, observation wells, and pumping rates for each of the tests.

1.2 Pumping Procedures

Submersible pumps were provided for aquifer testing by Verdad Group, LLC (in the case of TM-16 and FLEMING) and by Yellow Jacket Drilling for the other tests. Pumping rates varied depending on pump capacities, well productivities, and aquifer properties.

Pumping rates were measured using in-line flowmeters provided by Verdad and Yellow Jacket. In addition, flow rates were measured manually by measuring the time to fill a vessel of known volume (a bucket or a drum) using the “bucket and stopwatch” method. The flowmeter and stopwatch measurements were compared in the field and did not differ by more than 10% in any of the measurements.

1.3 Water Level Monitoring

Water level monitoring consisted of continuous monitoring (in the pumping and observation wells) prior to, during, and after pumping. In-Situ Level Trolls (Trolls), submersible pressure transducers and data loggers, were placed in the wells at sufficient depths to be submerged throughout the tests. The Trolls were vented to the atmosphere, thus measuring gauged pressures. The pressure ranges for each test were based on the anticipated maximum response of the well. Trolls with a range of 30 pounds per square inch were placed at a maximum depth of 69 feet below the static water level. These instruments can measure to an accuracy of 0.069 feet. Trolls with a range of 100 psi were used if drawdown was anticipated to be greater than 69 feet; the 100 psi trolls can be submerged by up to 230 feet of water, and can measure to an accuracy of 0.23 feet.

Hand measurements were collected throughout the tests to verify the Troll data. Depths to water were measured using a sounder to the nearest 0.01 foot. Hand measurements are provided in Tables N.4-2 through N.4-9.

1.4 Data Analysis

Pressure data from the Trolls were downloaded, and converted to depths to water. Water level drawdowns were calculated for the purposes of analysis. The data were reviewed to see if there were any unexplained changes that might indicate that the transducer vent was blocked, therefore needed to be corrected for barometric pressure. In addition, the manual depth to water measurements were compared with the Troll data to evaluate any inconsistencies. If necessary, the number of Troll data points was reduced to increase speed of the analysis.

The drawdown data were analyzed using AQTESOLV PRO version 4.50 (HydroSOLVE, Inc., 2007). A systematic approach was used to interpret the aquifer test data. Well construction, water level, and hydrostratigraphic data were used to identify well and aquifer data for each well tested and a general aquifer characterization (i.e., unconfined, confined, leaky, fractured, fully penetrating, etc.). The basin fill and bedrock wells are considered unconfined because there is no evidence of confining layers within the saturated zones of the wells tested. Basin fill well BMO-2010-3B is partially penetrating because the screen extends from the water table to 320 feet below surface (ft bls) while the bottom of the basin fill is at 386 ft bls. The bedrock wells are partially penetrating because the full depth of the bedrock aquifer is not known at the well sites. However, the saturated thickness was assumed to be equal to the length from the bottom of the filter pack to the top of the water table if in bedrock overlain by unsaturated basin fill (BMO-2010-1M, BMO-2010-2M, TM-16, TM-42, and FLEMING) or the bottom of the basin fill if overlain by saturated basin fill (BMO-2010-3B).

Analytical solutions were selected to reflect the basic constraints of unconfined, fully to partially penetrating conditions for the basin fill well and bedrock wells not overlain by saturated basin fill. Simple Theis models for confined and unconfined conditions were used as a first approximation for each test. Typically, the Theis model would not provide an acceptable fit to the measured drawdowns, indicating the test results departed form the simple ideal conditions of the Theis model. More complex aquifer models were used to account for factors that depart from the assumptions of the Theis model. Those factors potentially include wellbore storage, skin effect, linear and nonlinear well losses, delayed yield, leakage, and, in the case of bedrock, fracture-controlled flow. A leaky confined aquifer model was useful for matching data from some tests indicating that leakage from the overlying saturated basin fill or underlying bedrock played a role in flow during the test. Some wells displayed characteristics of fracture-controlled flow and fracture flow models were used to estimate hydraulic properties.

Optimization of the fit between observed drawdowns and drawdowns calculated for different aquifer models was conducted by visual curve matching using semi-log plots to compare different parameter estimates. The curve matching and automatic parameters estimation function in AQTESOLV were used to refine parameter estimates and evaluate parameter sensitivity. The test results were often fitted to more than one aquifer model. The use of multiple models resulted in a range of estimates for hydraulic properties for some tests. Preferred parameter estimates were identified in some cases. A range of hydraulic properties is provided if there was no preferred estimate.

Accurate estimation of storage coefficient is usually not possible using data only from the pumped well because drawdowns in the pumped well are affected by various head losses related to borehole characteristics and pumping. Because the transmissivity, hydraulic conductivity, and the storage coefficient are not independent variables, it was necessary to start the analyses with a reasonable storage coefficient value, on which to calculate the transmissivity or hydraulic conductivity. For the analyses of the 2008 tests, unconfined aquifers were analyzed using a starting storage coefficient value of 0.01 while confined aquifers were analyzed using a starting storage coefficient of 1×10^{-5}. The same methodology was used for the 2010 tests. In addition, a starting value of 0.1 was used as a starting approximation for vertical anisotropy (ratio of vertical to horizontal hydraulic conductivity).

2. RESULTS

2.1 TM-42

Conflicting data exist regarding the construction and screened interval of TM-42. ADWR records describe TM-42 as screened from 180 to 240 feet below land surface (ft bls) in Morita Formation. In contrast, Copper Queen Branch files contain a geologic log indicating that the TM-42 screen would be in basin fill. For the purposes of the data analysis, TM-42 was assumed to be screened in the Morita Formation in accordance with ADWR records. TM-42 had a wetted screen length of approximately 27 feet on the day of the aquifer test. The well is interpreted as being in an unconfined aquifer. TM-42 was pumped for 10 hours at rates between 8.5 and 17 gallons per minute (gpm), and a maximum drawdown of approximately 6.87 feet was measured. Hand measurements of water level drawdowns are shown in Table N.4-2 and compared to transducer measurements on Figure N.4-1.

The drawdown data showed no evidence of linear flow behavior that would suggest fracture controlled flow. The drawdown and recovery curves were initially analyzed using the Theis solution for unconfined aquifers; the match was reasonably good based on the AQTESOLV diagnostic statistics but the solution did not provide a good match the relatively flat portions of the drawdown curves. The Theis solution (Figure N.4-2) resulted in an estimated transmissivity of 691 feet squared per day (ft^2/day), and a hydraulic conductivity of 25.75 feet per day (ft/day) using an aquifer thickness of 26.87 feet. However, the predicted curve did not

match the flatness of the test observations curve for each pumping phase, indicating that the aquifer does not conform the simple ideal conditions of the Theis model. The Hantush Jacob leaky aquifer solution (Figure N.4-3) resulted in a better curve match, an estimated transmissivity of 555 feet squared per day (ft^2/day), and a hydraulic conductivity of 20.66 feet per day (ft/day) using an aquifer thickness of 26.87 feet and a storage coefficient of 0.004. The curve matched the flat portions of the drawdown curve better than the Theis solution, and the recovery data also had a better match. The Moench solution for an unconfined aquifer (Figure N.4-4) accounting for wellbore storage and skin and delayed gravity response had a satisfactory curve match, and the recovery curve match was a slightly better match than the Theis and Hantush Jacob solutions. The resulting transmissivity was 898.3 ft^2/day, the hydraulic conductivity was 33.43 ft/day, and the storage coefficient was 0.02.

2.2 FLEMING

The construction of the FLEMING well is uncertain due to the lack of geologic and well construction logs. The well is believed to be drawing water from the Morita Formation, but it is unknown whether there is screen or whether there is simply an open-ended PVC casing in an open borehole. The well owner has indicated that there is no well screen in the open borehole, while ADWR documentation indicates a screened interval from 385 to 455 feet. The well has a total depth of 455 feet. The static water level on the day of the aquifer test was 340.99 ft bls. For the purpose of this analysis the FLEMING well was assumed constructed of 5-inch diameter casing with 70 feet of screen, consistent with ADWR information.

The well was pumped successively at 5 gpm for 60 minutes, 17 gpm for 60 minutes, 28.5 gpm for 60 minutes, and 51 gpm for 420 minutes. Hand measurements of water level drawdowns are shown in Table N.4-3 and compared to transducer measurements on Figure N.4-5. The maximum observed drawdown was 9.11 feet.

The drawdown data were analyzed using a variety of solutions because curve matches were generally unsatisfactory. The best match to the observed drawdowns was provided using the Theis solution for a partially penetrating well in an unconfined aquifer (Figure N.4-6). However, this solution did not provide a satisfactory curve match for the different pumping periods or the recovery data, and the automatic parameter estimation routine calculated an unrealistic storage coefficient of 1.0. Assuming an aquifer thickness of 110 feet, the transmissivity and hydraulic conductivity were estimated to be 1,504 ft^2/day and 13.68 ft/day, respectively. It seems likely that there are unknown details of the well construction that prevent a better analysis of the data. The Theis confined solution with a fully penetrating well (Figure N.4-7) resulted in a hydraulic conductivity of 11.52 ft/day. Although the estimated hydraulic conductivity is in the range expected for Morita Formation, the poor fit of the observed drawdowns by the aquifer model indicate that the hydraulic properties estimated for the FLEMING well test are unreliable. Therefore, the test could not be reliably interpreted and no parameter estimates are provided.

2.3 BMO-2010-3M

BMO-2010-3M is screened in the Cintura Formation from a depth of 416 to 522 ft bls with a filter pack from 406 to 522 ft bls. The contact between the Cintura Formation and the

overlying saturated basin fill is at 386 ft bls. The static water level in BMO-2010-3M on the day of the aquifer test was 117.79 ft bls. BMO-2010-3M was pumped for 10 hours at rates between 23 and 46 gpm, and a maximum drawdown of approximately 40 feet was measured. Hand measurements of water level drawdowns are shown in Table N.4-4 and compared to transducer measurements on Figure N.4-8. Groundwater levels were also monitored in BMO-2010-3B 30 feet away from BMO-2010-3M and screened in the overlying basin fill. Figure N.4-9 shows the change in water level at BMO-2010-3B during pumping at BMO-2010-3M. The water level varied slightly in BMO-2010-3B, but there is no indication of a response to pumping and the variation in water level was within the accuracy range of the pressure transducer (0.069 ft).

The drawdown and recovery curve for BMO-2010-3M was analyzed using the Theis solution for a step test in a confined aquifer and accounting for well efficiency and partial penetration. The drawdown data are matched fairly well with the Theis solution (Figure N.4-10) and yielded a transmissivity of 770 ft^2/day assuming a storage coefficient of 10^{-5}. The Hantush Jacob solution for leaky aquifers (Figure N.4-11) was run to evaluate the potential for leakage from the saturated basin fill above the bedrock. The Hantush Jacob solution yielded a transmissivity of 530 ft^2/day assuming a storage coefficient of 10^{-5}. The two solutions had consistent results, but the Hantush Jacob solution provided a better match to the recovery data than did the Theis solution. The hydraulic conductivity estimated with the Theis and Hantush Jacob solutions were 5.09 ft/day and 3.5 ft/day respectively, assuming an aquifer thickness of 151 feet (length from the top of the bedrock to the bottom of the filter pack). Although BMO-2010-3M is in bedrock, the drawdown data did not show evidence of linear flow (i.e., straight line behavior in log-log space) indicating an equivalent porous medium behavior.

2.4 BMO-2010-3B

BMO-2010-3B is screened in basin fill from a depth of 120 to 320 ft bls. The basin fill is unconfined and extends from the static water table at 114.4 ft bls (at start of aquifer test) to the top of the underlying bedrock (Cintura Formation) at 386 feet bls. Thus, BMO-2010-3B partially penetrates the basin fill. BMO-2010-3B was pumped for 10 hours, and a maximum drawdown of approximately 10.5 feet was measured. Hand measurements of water level drawdowns are shown in Table N.4-5 and compared to transducer measurements on Figure N.4-12. Groundwater levels were monitored in BMO-2010-3M, which is located 30 feet away from BMO-2010-3B and screened in the underlying bedrock. As shown on Figure N.4-13, the water level varied in BMO-2010-3M during the pumping test, but the changes did not correlate with pumping at BMO-2010-3B. The water level in BMO-2010-3M dropped approximately 0.18 feet during the first 330 minutes of pumping in BMO-2010-3B, but increased by approximately the same amount from 330 minutes to 600 minutes while BMO-2010-3B was pumped at higher rates.

The drawdown and recovery curves for BMO-2010-3B were analyzed using the Theis solution for an unconfined aquifer and an aquifer thickness of 272 feet. However the slope of the curve at the different pumping rates was not a good match (Figure N.4-14). The Moench solution for an unconfined aquifer which accounts for partial penetration, skin, and wellbore storage was run. The Moench solution provided a fair approximation of the observed data (Figure N.4-15), but did not match the magnitude of drawdown in the second and third steps. The Hantush Jacob

solution for a partially penetrating well in a confined aquifer was used to evaluate the potential for leakage from the underlying bedrock to the basin fill since previous hydraulic testing had showed variable degrees of hydraulic connection between the basin fill and bedrock. The leaky aquifer solution provided a better match to the magnitude of drawdown for all three steps of the test (Figure N.4-16). The need to account for leakage to match the drawdown curve suggests that the basin fill received some flow from the underlying bedrock or contains a layer(s) acting as a leaky confined zone. There is no geologic evidence for the latter. The Theis analysis resulted in a transmissivity of 2463 ft^2/day and a hydraulic conductivity of K = 9.7 ft/day. The transmissivity and hydraulic conductivity estimated by the Moench solution were 5,632 ft^2/day and 20.7 ft/day, respectively, assuming an aquifer thickness of 272 feet. The transmissivity and hydraulic conductivity estimated by the Hantush Jacob solution were 2,810 ft^2/day and 10.33 ft/day, respectively. The Hantush Jacob solution provided the best overall approximation to the observed data and is the preferred even though it is for a confined aquifer. The three hydraulic conductivity estimates vary by a factor of two and probably bracket the likely range of average hydraulic conductivity.

2.5 TM-16

TM-16 is screened within the Morita Formation from a depth of 65 to 115 feet. The static water level at the start of the aquifer test was 84.98 ft bls so that the length of the wetted screen interval was about 31 feet. TM-16 was pumped for 10 hours, and a maximum drawdown of approximately 18.2 feet was recorded. Hand measurements of water level drawdowns are shown in Table N.4-6 and compared to transducer measurements on Figure N.4-17. The

transducer measurements show a recovery of one foot from about 40 minutes to 80 minutes. This recovery was not measured by hand using a sounder and appears to be due to slipping of the transducer. Water levels were measured in BMO-2010-1M during pumping of TM-16. BMO-2010-1M is screened from 440 to 540 ft bls and located about 300 feet to the north of TM-16. As shown by Figure N.4-18, the pressure transducer appears to have suddenly slipped at about 100 minutes into the test. Otherwise, however, the water level in BMO-2010-1M increased slightly during the test, indicating no interpretable response to pumping at TM-16.

The drawdown and recovery curves for TM-16 were analyzed using the Theis, Moench, and Papadapoulos-Cooper solutions for a fully-penetrating well. Only the Moench and Papadapoulos-Cooper solutions had satisfactory curve matches. The Papadapoulos-Cooper solution (Figure N.4-19) yielded a hydraulic conductivity of 6.959 ft/day; although the storage coefficient had to be adjusted to 1×10^{-7} to result in a good curve match. The Moench solution for fracture flow and spherical blocks (Figure N.4-20) yielded a hydraulic conductivity for fractures of 7.57 ft/day using a storage coefficient of 1.26×10^{-5}. The fit of the test data provided by the Moench solution was not sensitive to the hydraulic conductivity the matrix (i.e. the aquifer material), indicating that the groundwater flow to the well is in fractures. The log-log plot of the drawdown is also indicative of fracture flow as being the primary mode of groundwater flow. The radius of the well casing had to be increased to over five feet to get a curve match for the Moench solution, suggesting that fractures provide significant wellbore storage in the vicinity of the well.

Steffan, Robertson and Kirsten (SRK) interpreted a previous aquifer test of this well (SRK, 1997). SRK (1997) used the Papadapoulos-Cooper solution for a fully penetrating well and calculated a hydraulic conductivity of 2.2 ft/day using an aquifer thickness of 100 feet. The saturated thickness assumed by SRK (1997) was incorrect as there was only about 30 feet of wetted screened interval at the time. If a 30-foot aquifer thickness had been used, SRK (1997) would have calculated a hydraulic conductivity of 6.6 ft/day, which is consistent with the present analysis.

2.6 BMO-2010-1M

BMO-2010-1M is screened in the Morita Formation from a depth of 440 to 540 ft bls and with a filter pack from 430 to 556 ft bls. The static water level in BMO-2010-1M at the start of the aquifer test was 222.3 ft bls. The water level is interpreted to represent a phreatic surface because no obvious confining feature has been observed. However, BMO-2010-1M could intersect fractures at a variety of pressure regimes and it would be difficult to know that based on the available data. A constant rate aquifer test at 2.6 gpm was conducted at BMO-2010-1M rather than a step test because field personnel observed during well development and pump placement that the well produced low volumes of water. BMO-2010-1M was pumped for 10 hours at 2.6 gpm and a maximum drawdown of just over 50 feet was measured. Hand measurements of water level drawdowns are shown in Table N.4-7 and compared with transducer measurements on Figure N.4-21. TM-16, which is located 307 feet to the north, was manually gauged during pumping at BMO-2010-1M. As shown on Figure N.4-22, the water

level in TM-16 increased slightly during the aquifer test (Table N.4-8), indicating no interpretable response to pumping at TM-16.

Although BMO-2010-1M is in bedrock, the drawdown data did not show evidence of linear flow (i.e., straight line behavior in log-log space) indicating an equivalent porous medium behavior. The drawdown and recovery curves were analyzed using the Theis unconfined (partially penetrating well) solution, the Hantush Jacob solution (partially-penetrating well), and the Moench solution for spherical blocks (partially penetrating well). The unconfined Theis solution (Figure N.4-23) used a storage coefficient of 0.01 and yielded transmissivity and hydraulic conductivity estimates of 24.89 ft^2/day and 0.076 ft/day, respectively, assuming an aquifer thickness of 328 feet). However, the curve match was not satisfactory, particularly during the late stages of pumping, suggesting that the aquifer was not acting according to Theis solution assumptions.

The Hantush Jacob solution for leaky aquifers (Figure N.4-24) resulted in a better curve match than did the Theis solution, yielding transmissivity and hydraulic conductivity estimates of 11.11 ft^2/day and 0.034 ft/day, respectively and a storage coefficient of 0.3. The Moench solution for fractured aquifers with spherical blocks (Figure N.4-25) also resulted in a satisfactory curve match; it estimated the hydraulic conductivity for the aquifer at 0.023 ft/day and the hydraulic conductivity for the aquifer matrix of 1.77×10^{-6} ft/day. The Moench hydraulic conductivity estimate for the aquifer is consistent with the Hantush Jacob result. However, the storage coefficient calculated by AQTESOLV using this solution, 3.04×10^{-12}, was not consistent with those previously used for the Morita Formation. For this reason, the Hantush Jacob solution results are considered more reliable.

2.7 BMO-2010-2M

BMO-2010-2M is screened in the Morita Formation from a depth of 268.5 to 370 ft bls and a filter pack from 257 to 388 ft bls. The static water level in BMO-2010-2M was 263.85 ft bls at the start of the aquifer test. The water level is interpreted to represent a phreatic surface because no obvious confining feature has been observed. However, BMO-2010-2M could intersect fractures at a variety of pressure regimes and it would be difficult to know that based on the available data. BMO-2010-2M was pumped for 10 hours and a maximum drawdown of approximately 16.9 feet was measured. Hand measurements of water level drawdowns are shown in Table N.4-9 and compared to transducer measurements on Figure N.4-26.

The drawdown data for BMO-2010-2M display linear flow behavior (straight line segments in log-log plots) indicative of fracture controlled flow. Semi-log plots of drawdown show a gradual steepening over time. Drawdown and recovery data were analyzed using solutions for flow in fractured aquifers because the data show linear flow characteristics. The Moench solution for fractured aquifers with spherical blocks (Figure N.4-27) and the Moench solution for slab blocks (Figure N.4-28) displayed similar fits to the observed data. The hydraulic conductivity of the aquifer was estimated at 0.37 ft/day using the Moench solution with slab blocks and 0.26 ft/day using the Moench solution with spherical blocks. The solutions varied significantly in their estimates of the hydraulic conductivities of the matrix; the slab blocks solution estimated the hydraulic conductivity of the matrix at 165 ft/day while the spherical blocks solution estimated the hydraulic conductivity of the matrix at 4 ft/day. However, neither

solution was sensitive to this parameter, as the fluid flow is primarily in fractures, as evidenced by the straight line segments of the curve.

3. DISCUSSION

Tabulated results of aquifer testing are provided in Table 15 of the main text. Results of aquifer testing in 2010 were consistent with the results of 2008 testing, but there were some notable differences in the results. Only one basin fill well, BMO-2010-3B, was tested in 2010. Analysis of the 2010 data indicates that the basin fill material has a hydraulic conductivity of approximately 10 to 20 ft/day. In 2008, hydraulic conductivity estimates for the basin fill were between 100 ft/day and 2 ft/day, with an average value of 40 ft/day and a geometric average of 29 ft/day. The hydraulic conductivity of basin fill calculated at BMO-2010-3B is consistent with the lower values calculated in 2008.

Results of aquifer testing of wells screened in bedrock were variable. Testing at TM-16, BMO-2010-1M, BMO-2010-2M, and BMO-2010-3M had results ranging from 0.03 to 7.6 ft/day, which is generally consistent with previous results from testing in 2008. TM-42 had a hydraulic conductivity of 20 to 33 ft/day. The higher hydraulic conductivity at TM-42 relative to the other bedrock test may be due to the presence of more water-bearing fractures, possibly resulting from its proximity to the Black Gap Fault. The curve match for the FLEMING test was not satisfactory despite attempts at various solutions, and conflicting data from the well owner and ADWR records suggest that we do not understand the construction of this well. The analysis of the FLEMING well is not reported on Table 15 because it is unreliable.
