Mr. Kurt Vollbrecht, Manager
New Mexico Environment Department
Ground Water Quality Bureau
Mining Environmental Compliance Section
P. O. Box 5624
Santa Fe, New Mexico 87502

Dear Mr. Vollbrecht:

**Re: Annual Monitoring Report, Groundhog Mine Site IRA
Hanover-Whitewater Creeks Investigation Unit, Chino AOC**

Freeport-McMoRan Chino Mines Company (Chino) submits the attached Annual Monitoring Report for the completed Groundhog Mine Site Interim Remedial Action (IRA) for the monitoring period ending September 30, 2017. The Groundhog Mine Site IRA was performed by Chino pursuant to requirements of the Administrative Order on Consent between the New Mexico Environment Department (NMED) and Chino.

As per Section 6.0 of the IRA Completion Report dated June 10, 2009, this annual monitoring report includes the bulleted information listed below with the exception of the annual vegetation monitoring survey. Chino has performed a quantitative five year vegetation survey as per the Completion Report requirements which was submitted to NMED September 30, 2016. NMED approved the *Vegetation Monitoring Report for the Groundhog Mine Site and Small Historic Stockpile Sites Interim Remedial Action* in a letter dated August 31, 2017 following Chino's letter which provided responses to their comment letter on June 13, 2017.

- Data tabulation sheet of analytical results screened against NM Groundwater Quality Standards from monitoring well and surface water samples collected at the Groundhog Mine site;
- Copies of the original laboratory data sheets; and
- The quarterly erosion surveys.

Additionally, this report includes information described in Section 6.0 of the Completion Report for the Osceolla, CG Bell, and Tenderfoot B Stockpiles IRA. These three historical mine sites are proximal and have similar requirements as the Groundhog IRA. The five year quantitative vegetation survey report submitted September 30, 2016 also addresses these sites and thus no further annual vegetation surveys are required as provided in the Completion Report. The following information is also attached for these stockpiles:

- Quarterly erosion reports for the three historic small stockpiles are included with the Groundhog Mine Site quarterly monitoring survey.
- Also included are monitoring reports for the Star Stockpile.
- Figure 1 illustrates locations for all of the IRA sites.

The attached ground water quality data are for monitor wells GH-2004-2S and GH-2004-2D. See Figure 1 for well locations. Noted in the shallow ground water quality is a trend beginning in 2009

which shows an increase in concentrations for cadmium, manganese, sulfate, TDS, and zinc. Chino currently attributes this to oxidation in underground workings, and is being addressed as part of the Discharge Permit (DP) 1340 Site Wide Abatement (SWA) process. A *Draft Revised Final Site Investigation Report* under, Site Wide Stage 1 Abatement dated March 30, 2016 is under review by NMED that includes the Groundhog Mine Site.

The other water quality data in the table are from three surface impoundment locations. The surface impoundment sampling locations include the Lower Stormwater Sump "GH-Sump" and the Lower Stormwater Pond "GH-Lower Pond" which make up the Groundhog Mine seepage collection system located up gradient of, and including the headwall. See Figure 1. Surface water from this collection system when present is pumped to Reservoir 17 for use as process water. The third surface impoundment sample site is the Upper Stormwater Pond "GH-Upper Pond" which was removed during the supplemental site remediation in 2011 as the containment was no longer needed to alleviate subsurface flow through the adjacent stockpile material supporting the old pipeline corridor. Sampling of this site ceased upon its removal. This pond was located north of the haul road that divides the Groundhog Mine site.

Chino has continued monitoring surface water quality for improvements from remediation at this seepage collection system for approximately ten years as it is the downstream drainage endpoint for the Groundhog Mine Site. Sample results are provided in this annual report as required in the Groundhog IRA Completion Report to establish improving water quality that upon reaching standards, and following the Record Of Decision, the watershed surface water from the remediated mine site runoff would be allowed to flow into Whitewater Creek.

Current, active mining operations include a tailing and process water pipeline corridor that divides the IRA site and the GH-Sump and GH-Lower Pond are ideally situated for secondary containment for leaks from the active pipelines. As such, they are included as part of the contingency pipeline spill containment system as described under Discharge Permit DP-213. A pipeline spill in February 2017 was captured by the ponds and although the spilled material was completely removed, recent sample data from GH-Lower Pond now reflects residual tailing effects. Therefore, this portion of the Groundhog Mine Site can no longer be considered part of the IRA as the remedial objectives cannot be met.

Chino proposes the post reclamation monitoring language in the Completion Report be amended such that the surface water is no longer monitored, the seepage collection system and drainage be excluded from the IRA as they are now part of operations and utilized for process water containment. The seepage collection system as indicated on Figure 2 would be designated as mine operations infrastructure as is the current haul road, pipeline corridors, and utility lines that divide the IRA site into different sections. Pertinent language from Section 6.0 of the Completion Report currently states the following:

6.0 POST-RECLAMATION MONITORING

This section presents the post-reclamation monitoring plan for the Groundhog Mine Site. The plan includes monitoring water quality The Groundhog site will remain under the oversight of the Chino AOC at least until the Record of Decision for the Hanover and Whitewater Creeks Investigation Unit has been approved by NMED. Monitoring may then be included as part of the long-term closeout actions for Chino under DP-1340.

6.1 Water-Quality Monitoring

Surface water will be sampled semiannually from three locations. Surface water from the upper and lower stormwater ponds will be sampled semiannually if water is present.

Samples will also be collected semiannually from the lower stormwater sump (which is a standpipe in the pond footprint) if water is present. Water sampling will be conducted in September and March, This effort tries to collect late winter/early spring runoff and summer monsoon flows. Results will be submitted in the Groundhog Annual Monitoring Report, due at the end of October.

While some variability in the data over time is expected due to seasonal effects and the amount of precipitation prior to the sampling event, the concentrations are expected to reach consistent levels as vegetation stabilizes the soil cover and disturbed bedrock surfaces are exposed to rainfall and runoff. Evidence of decreasing metals concentrations and increasing pH was shown by the data collected during installation of the soil cover and these trends are expected to continue now that the interim closure is complete. Once stabilization is indicated by semiannual sampling data, sampling frequency may increase to quarterly to establish that remedial action criteria established in the ROD have been met.

..... Results of surface and groundwater monitoring will be reported to NMED annually. Once surface-water quality meets remedial action criteria established in the ROD, the cutoff wall may be removed, allowing Groundhog Mine Site stormwater to flow through the unnamed tributary and then into Whitewater Creek. The monitoring wells may then be incorporated into DP-526.

.... Since removal of the stockpiles, metal concentrations have decreased and the pH has increased, showing some water-quality improvement. Water quality is expected to continue to improve as the soil cover becomes stabilized by vegetation. When water meets the criteria necessary to be discharged off site, the site will be included in the site-wide Storm Water Pollution Prevention Plan (SWPPP), pursuant to the Environmental Protection Agency's NPDES, Multi-Sector General Permit program.

Chino proposes to monitor the surface water and groundwater for the following suite of analytes: cadmium, calcium, cobalt, copper, fluoride, iron, magnesium, manganese, nickel, lead, zinc, pH, total dissolved solids, and sulfate. These analytes have been detected in samples from the lower stormwater sump during semiannual monitoring ... and were detected in SPLP leachate from samples of the stockpile material during the initial site investigation (Golder, 2001). This list of analytes also includes the metals detected in elevated concentrations in the bedrock surface samples discussed in Section 5.3.2.

Chino will continue monitoring groundwater semi-annually but as proposed above, we would like to discuss the ineffectiveness of surface water monitoring which no longer reflects IRA monitoring improvements but residual effects following operational pipeline repairs. Amending Section 6.1 of the Completion Report will reset the objective for the surface water at the IRA site to be contained on site as part of operational contingency containment process.

If you require additional information regarding this submittal, please contact Ms. Alicia Voss at (602) 366-8049.

Sincerely,

Sherry Burt-Kested, Manager

ANALYTICAL REPORT FOR SAMPLES

Sample ID	Laboratory ID	Matrix	Date Sampled	Sampled By	Date Received	Notes
347288 / GH-2004-2D	X7F0091-01	Water	01-Jun-17 09:30	LS	06-Jun-2017	
347289 / GH-2004-2S	X7F0091-02	Water	01-Jun-17 10:06	LS	06-Jun-2017	

Solid samples are analyzed on an as-received, wet-weight basis, unless otherwise requested.

Sample preparation is defined by the client as per their Data Quality Objectives.

This report supersedes any previous reports for this Work Order. The complete report includes pages for each sample, a full QC report, and a notes section.

The results presented in this report relate only to the samples, and meet all requirements of the NELAC Standards unless otherwise noted.

Notes and Definitions

D2 Sample required dilution due to high concentration of target analyte.

M2 Matrix spike recovery was low, but the LCS recovery was acceptable.

M3 The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The LCS was acceptable.

LCS Laboratory Control Sample (Blank Spike)

RPD Relative Percent Difference

UDL A result is less than the detection limit

R > 4S % recovery not applicable, sample concentration more than four times greater than spike level

<RL A result is less than the reporting limit

MRL Method Reporting Limit

MDL Method Detection Limit

N/A Not Applicable

Notes and Definitions

D1	Sample required dilution due to matrix.
D2	Sample required dilution due to high concentration of target analyte.
M3	The spike recovery value is unusable since the analyte concentration in the sample is disproportionate to spike level. The LCS was acceptable.
R5	MS/MSD RPD exceeded the laboratory acceptance limit. Recovery met acceptance criteria.
LCS	Laboratory Control Sample (Blank Spike)
RPD	Relative Percent Difference
UDL	A result is less than the detection limit
0.30R>S	% recovery not applicable; spike level is less than 30% of the sample concentration
<RL	A result is less than the reporting limit
MRL	Method Reporting Limit
MDL	Method Detection Limit
N/A	Not Applicable
