RESUBMISSION

Gamma Spectroscopy

Case Narrative

Freeport McMoRan Sierrita

FMI-VRP

Work Order Number: 0812177

1. The following report consists of analytical results and supporting documentation for 19 soil samples received by ALS Paragon on 12/17/08.
2. These samples were prepared according to procedure SOP739R9. Samples 0812177-2, -2DUP, -3, -5, -6, -7, -10, and -16 were sealed in steel cans on 12/24/08 and stored for at least 21 days to allow ^{222}Rn to approach equilibrium with its progeny. The degree of in-growth achieved prior to analysis on 01/15/09 is at least 97.8%. Conservatively assuming a radon emanation efficiency of approximately 50%, the effective radon progeny in-growth for these samples would be greater than 98.9%. The remaining samples in the work order were packed in standard 100 gram geometry and analyzed for ^{228}Ra only.
3. The samples were analyzed for the presence of gamma emitting radionuclides according to procedure SOP713R10. The analyses were completed on 01/15/09.
4. The results for these samples are reported on a "Dry Weight" basis in units of pCi/gram.
5. Sample volumes were insufficient to allow preparation of duplicates. A duplicate analysis of sample 0812177-2 was performed in lieu of a prepared duplicate.
6. ALS Paragon has observed a reproducible low bias in ^{226}Ra results (about -30% for the geometry in question) when using a mixed gamma source for the calibration of HPGe detectors for solid samples. This bias is eliminated by calibration using a NIST traceable ^{226}Ra source in the same geometry and configuration as the samples.
7. The library used for calibration and analysis for samples 0812177-2, -2DUP, -3, -5, -6, -7, -10, and -16 employs multiple peaks for the ^{226}Ra progeny, ^{214}Pb (352 and 295 keV) and ^{214}Bi (609 and 1120 keV). Using these peaks avoids the use of the problematic ^{226}Ra photo-peak at 186 keV, which suffers from poorly resolvable interference from ^{235}U at the same energy. Final activity results for ^{226}Ra are calculated, using the uncertainty-weighted mean of the activities for the four photo-peaks, by the Seeker gamma spectroscopy software assuming secular

equilibrium.

8. Activity concentrations above the calculated MDC are reported in some instances where minimum nuclide identification criteria are not met. Such tentative identifications result when the software attempts to calculate net activity concentrations for analytes where either one or both of the following criteria are not satisfied: the 'diagnostic' peak for a nuclide must be identified above the critical level, or the minimum library peak abundance must be attained. Nuclides not meeting these requirements have been flagged with a "T1" qualifier.
9. There are cases where the sample density is less than the associated calibration standard density. Cases that exceed the limit of +/- 15% of the density of the calibration standard are flagged with a 'G', denoting a significant density difference between the sample and calibration standard. Consequently, the results may be biased high for the flagged results in this work order. If requested, ALS Paragon can perform a transmission spike in order to estimate a magnitude of this bias. The results are reported without further qualification.
10. Due to the nature of electronics involved in gamma spectroscopy, any detector acquiring data with the same multi-channel buffer (MCB) is affected by all other detector inputs in that same MCB. A high activity calibration source was counting in detector 4, which is in the same MCB as detector 3. GS090106-3LCS was counted in detector 3 on 01/13/09. Thus, the observed dead time for this sample count was greater than 10% at 10.63%. Analyst review of the data does not indicate a problem with the spectral acquisition for this sample. All radiometric recoveries were within the requested acceptance criteria of +/- 15%. Results are submitted without further qualification. Please refer to QASS 360430.
11. The requested detection limit of 1 pCi/gram for ^{228}Ra was not met for samples 0812177-3, -7, -9, -11, -14, -15, and -17, as identified with an "M3" qualifier on the final reports. The reported activity for these samples is greater than the achieved detection limit. Results are submitted without further qualification.
1. No further problems were encountered with either the client samples or the associated quality control samples. All remaining quality control criteria were met.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

CONDITION OF SAMPLE UPON RECEIPT FORM

Paragon Analytics

Client: FreeportWorkorder No: 0812177Project Manager: JEInitials: COTDate: 12-17-08

1. Does this project require any special handling in addition to standard Paragon procedures?	YES	<input checked="" type="radio"/> NO
2. Are custody seals on shipping containers intact?	NONE	<input checked="" type="radio"/> YES NO
3. Are Custody seals on sample containers intact?	<input checked="" type="radio"/> NONE	YES NO
4. Is there a COC (Chain-of-Custody) present or other representative documents?	<input checked="" type="radio"/> YES	NO
5. Are the COC and bottle labels complete and legible ?	<input checked="" type="radio"/> YES	NO
6. Is the COC in agreement with samples received? (IDs, dates, times, no. of samples, no. of containers, matrix, requested analyses, etc.)	<input checked="" type="radio"/> YES	NO
7. Were airbills / shipping documents present and/or removable?	DROP OFF	<input checked="" type="radio"/> YES NO
8. Are all aqueous samples requiring preservation preserved correctly ? (excluding volatiles)	<input checked="" type="radio"/> N/A	YES NO
9. Are all aqueous non-preserved samples pH 4-9 ?	<input checked="" type="radio"/> N/A	YES NO
10. Is there sufficient sample for the requested analyses?	<input checked="" type="radio"/> YES	NO
11. Were all samples placed in the proper containers for the requested analyses?	<input checked="" type="radio"/> YES	NO
12. Are all samples within holding times for the requested analyses?	<input checked="" type="radio"/> YES	NO
13. Were all sample containers received intact ? (not broken or leaking, etc.)	<input checked="" type="radio"/> YES	NO
14. Are all samples requiring no headspace (VOC, GRO, RSK/MEE, Rx CN/S, radon) headspace free? Size of bubble: <u> </u> < green pea <u> </u> > green pea	<input checked="" type="radio"/> N/A	YES NO
15. Do perchlorate LCMS-MS samples have headspace ? (at least 1/3 of container required)	<input checked="" type="radio"/> N/A	YES NO
16. Were samples checked for and free from the presence of residual chlorine ? (Applicable when PM has indicated samples are from a chlorinated water source; note if field preservation with sodium thiosulfate was not observed.)	<input checked="" type="radio"/> N/A	YES NO
17. Were the samples shipped on ice ?	YES	<input checked="" type="radio"/> NO
18. Were cooler temperatures measured at 0.1-6.0°C? IR gun used*: #2 #4	<input checked="" type="radio"/> RAD ONLY	YES <input checked="" type="radio"/> NO
Cooler #: <u>1</u>		
Temperature (°C): <u>Amb</u>		
No. of custody seals on cooler: <u>1</u>		
External µR/hr reading: <u>14</u>		
Background µR/hr reading: <u>13</u>		
Were external µR/hr readings ≤ two times background and within DOT acceptance criteria? <input checked="" type="radio"/> YES <input type="radio"/> NO / NA (If no. see Form 008.)

**After printing this label:**

1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Section 2

SAMPLE RESULTS SUMMARY

Due to the nature of gamma spectroscopy data, a summary report is not provided.

Please refer to the individual sample results in Section 4.

Section 3

QC RESULTS SUMMARY

Gamma Spectroscopy Results

PAI 713 Rev 10

Method Blank Results

Lab Name: ALS Paragon

Work Order Number: 0812177

Client Name: Freeport McMoRan Sierrita

ClientProject ID: FMI-VRP

Lab ID: GS090106-3MB

Library: Ra-228

Sample Matrix: SOIL

Prep SOP: PAI 739 Rev 9

Date Collected: 31-Dec-08

Date Prepared: 31-Dec-08

Date Analyzed: 13-Jan-09

Prep Batch: GS090106-3

QCBatchID: GS090106-3-1

Run ID: GS090106-3A

Count Time: 45 minutes

Final Aliquot: 94.1 g

Result Units: pCi/g

File Name: 090060d09

CASNO	Target Nuclide	Result +/- 2 s TPU	MDC	Requested MDC	Lab Qualifier
15262-20-1	Ra-228	0.20 +/- 0.34	0.59	1	U

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC or less than the associated TPU
Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.
Y2 - Chemical Yield outside default limits.
LT - Result is less than Requested MDC, greater than sample specific MDC.
SQ - Spectral quality prevents accurate quantitation.
SI - Nuclide identification and/or quantitation is tentative.
TI - Nuclide identification is tentative.
R - Nuclide has exceeded 8 half-lives.
M - Requested MDC not met.
B - Analyte concentration greater than MDC.
B3 - Analyte concentration greater than MDC but less than Requested MDC.

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)
MDC - Minimum Detectable Concentration (see PAI SOP 709)
BDL - Below Detection Limit

DER - Duplicate Error Ratio (see PAI SOP 715)

BDL - Below Detection Limit

NR - Not Reported

SQ - Spectral quality prevents accurate quantitation.

SI - Nuclide identification and/or quantitation is tentative.

TI - Nuclide identification is tentative.

R - Nuclide has exceeded 8 half-lives.

G - Sample density differs by more than 15% of LCS density.

CASNO	Analyte	Sample Result +/- 2s TPU	Duplicate Result +/- 2s TPU	DER	Control Limit	Lab Qualifiers
15262-20-1	Ra-228	1.9 +/- 0.67	1.2 +/- 0.45	0.80	2.13	

Comments:

Duplicate Qualifiers/Flags:

U - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

W - DER is greater than Warning Limit of 1.42

D - DER is greater than Control Limit of 2.13

LT - Result is less than Request MDC, greater than sample specific MDC

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)

DER - Duplicate Error Ratio (see PAI SOP 715)

BDL - Below Detection Limit

NR - Not Reported

SQ - Spectral quality prevents accurate quantitation.

SI - Nuclide identification and/or quantitation is tentative.

TI - Nuclide identification is tentative.

R - Nuclide has exceeded 8 half-lives.

G - Sample density differs by more than 15% of LCS density.

CASNO	Target Nuclide	Result +/- 2 s TPU	MDC	Requested MDC	Lab Qualifier
13982-63-3	Ra-226	2.7 +/- 0.46	0.54	1	

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC or less than the associated TPU

Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.

Y2 - Chemical Yield outside default limits.

LT - Result is less than Requested MDC, greater than sample specific MDC.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

M - The requested MDC was not met.

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)

MDC - Minimum Detectable Concentration (see PAI SOP 709)

BDL - Below Detection Limit

SQ - Spectral quality prevents accurate quantitation.

SI - Nuclide identification and/or quantitation is tentative.

TI - Nuclide identification is tentative.

R - Nuclide has exceeded 8 half-lives.

G - Sample density differs by more than 15% of LCS density.

Final Aliquot: 78.7 g

Prep Basis: Dry Weight

Moisture(%): NA

Result Units: pCi/g

File Name: 090056d09

CASNO	Target Nuclide	Result +/- 2 s TPU	MDC	Requested MDC	Lab Qualifier
15262-20-1	Ra-228	1.9 +/- 0.67	1.0	1	G

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC or less than the associated TPU

Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.

Y2 - Chemical Yield outside default limits.

LT - Result is less than Requested MDC, greater than sample specific MDC.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

M - The requested MDC was not met.

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)

MDC - Minimum Detectable Concentration (see PAI SOP 709)

BDL - Below Detection Limit

SQ - Spectral quality prevents accurate quantitation.

SI - Nuclide identification and/or quantitation is tentative.

TI - Nuclide identification is tentative.

R - Nuclide has exceeded 8 half-lives.

G - Sample density differs by more than 15% of LCS density.

Technical Comments Regarding Gamma Spectroscopy Libraries

Library File: Ra-226.LIB

Nuclide: Ra-226 Energy: various Photon Abundance: various

Samples analyzed by this library are sealed in a steel can and allowed to ingrow for a 21-day period to ensure the capture and full ingrowth of the Rn-222 gas and associated progeny. The Bi-214 and Pb-214 daughters are assumed to be in secular equilibrium with their parent, Ra-226. Ra-226 is then quantified from the ingrown Pb-214 and Bi-214 daughters using the 1600 year half-life of the Ra-226 parent.

QUALITY ASSURANCE SUMMARY SHEET

PAI W.O. # / BATCH _____

TEST X spec

METHOD _____

SOP/REV (PREP) 737R4SOP/REV (ANAL) 713R6

Briefly document any QA or other problems or deviations associated with the analysis of samples. Problems could result from: log-in, color, odor, dilution, consistency, scheduling, equipment, or instrumentation, or may include documentation of minor deviations necessary due to unique DQO's or sample characteristics.

After having difficulties verifying the new Ra-228 standard from Analytics (PAI Standard # 594) via gamma spec, Don Montgomery from Analytics was contacted and a copy of the gamma Ra-228 library was sent. He replied that Analytics had updated their library with new abundances obtained from the National Nuclear Data Center at Brookhaven National Lab. After verifying the abundance values being used by Analytics, it was decided that all Ra-228/Ac-228/Th-232 libraries would be updated to reflect these more current values. All such libraries have since been updated. A list of the previously used and currently used abundances for this nuclide is provided below.

Energy Line	Previous abundance	Current abundance
338.4	12.01%	11.27%
911.07	29.00%	25.80%
969.9	17.46%	15.80%

Problems could result from: log-in, color, odor, dilution, consistency, scheduling, equipment, or instrumentation, or may include documentation of minor deviations necessary due to unique DQO's or sample characteristics.

MC
01/28/09

The laboratory control sample GS090106-3LCS was counted on 1/13/09 in detector 3. The observed dead time for the count of the laboratory control sample was greater than 10%, at 10.63%. During the spectral acquisition of this source, a high activity calibration source was counting in detector 4. This detector is in the same multi-channel buffer (MCB) as detector 3. Due to the nature of the electronics involved in gamma spectroscopy, any detector acquiring data within the same MCB is affected by all other detector inputs in that MCB. Thus, the source activity in detector 4 caused an increase in the dead time observed for the entire MCB containing detectors 3 and 4. Analyst review of the raw data does not indicate any problems with the spectral acquisition for these samples. All radiometric recoveries were within the requested acceptance criteria of +/- 15%. All data quality objectives were met and the results are submitted without further qualification.

Ra-226 Sand in Steel Can

This standard radionuclide source was prepared using an aliquot measured gravimetrically from a calibrated master radionuclide solution source which was calibrated using a germanium gamma spectrometer system. This calibration has been confirmed by the National Institute of Standards and Technology through participation in a Measurements Assurance Program as described in USNRC Reg. Guide 4.15, Revision 1, February 1979.

Radionuclide purity and calibration were checked using a germanium gamma spectrometer system and alpha spectroscopy system. The nuclear decay rate and assay date for this source are given below.

100 Grams Sand in 16 Ounce PP MRP Jar

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

75356-307

100 Grams of Sand in 16 Ounce PP MRP Jar

Customer: Paragon Analytics

P.O. No.: 72905, Item 3

Calibration Date: 01-Jul-2007 12:00 EST **Grams of Master Source:** 0.011387

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

55 mL / 100 grams of customer supplied sand.

This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

RSO# 855

76484A-307
Sand in 16 Ounce PP MRP Jar

Customer: Paragon Analytics / Fort Collins, CO
P.O. No.: 72905 REL 12-13-07, Item 3
Calibration Date: 01-Jan-2008 12:00 EST **Grams of Master Source:** 0.011313

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

500 grams / 290 mL of customer supplied sand.
This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

75356-307

100 Grams of Sand in 16 Ounce PP MRP Jar

Customer: Paragon Analytics

P.O. No.: 72905, Item 3

Calibration Date: 01-Jul-2007 12:00 EST **Grams of Master Source:** 0.011387

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

55 mL / 100 grams of customer supplied sand.

This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION Standard Radionuclide Source

73489-307 *RSO #826* *Rec'd 8/09/06*
DUS

100 Grams Sand in 16 Ounce PP MRP Jar

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytix maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

Calibration date: July 1, 2006 12:00 EST

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

77651-307

100 Grams Sand in 16 Ounce PP MRP Jar

Customer: Paragon Analytics

P.O. No.: 73625, 5/19/08 Rel., Item 3

Calibration Date: 01-Jul-2008 12:00 EST **Grams of Master Source:** 0.01114

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

55 mL/100 grams customer supplied sand.

This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

77651-307

100 Grams Sand in 16 Ounce PP MRP Jar

Customer: Paragon Analytics

P.O. No.: 73625, 5/19/08 Rel., Item 3

Calibration Date: 01-Jul-2008 12:00 EST **Grams of Master Source:** 0.01114

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

Y-88	1836.1	106.6	4.398E+05	4.899E+03	0.7	1.1	2.6	HPGe

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

55 mL/100 grams customer supplied sand.

This standard will expire one year after the calibration date.

Standard Radionuclide Source

73489-307 *RSO #826* *Rec'd 8/29/06*
DUS

100 Grams Sand in 16 Ounce PP MRP Jar

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

73489-307 *RSO #826* *Rec'd 8/29/06*
DUS

100 Grams Sand in 16 Ounce PP MRP Jar

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytix maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

Calibration date: July 1, 2006 12:00 EST

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

75357B-307

215 Grams of Sand in Metal Can

Customer: Paragon Analytics

P.O. No.: 72905, Item 4

Calibration Date: 01-Jul-2007 12:00 EST **Grams of Master Source:** 0.011421

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

215.14 grams (~140 cc) of customer supplied sand.

This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

75357B-307

215 Grams of Sand in Metal Can

Customer: Paragon Analytics

P.O. No.: 72905, Item 4

Calibration Date: 01-Jul-2007

12:00 EST

Grams of Master Source: 0.011421

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

215.14 grams (~140 cc) of customer supplied sand.

This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

73490-307

RSO#407 Rec'd 8/29/06
JS

215 Grams Sand in Metal Can

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytisc maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

Calibration date: July 1, 2006 12:00 EST

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

77652-307

215 Grams of Sand in Metal Can

Customer: Paragon Analytics
P.O. No.: 73625, 5/19/08 Rel., Item 4
Calibration Date: 01-Jul-2008 12:00 EST **Grams of Master Source:** 0.011374

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solutions. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Revision 1, February, 1979, and compliance with ANSI N42.22-1995, "Traceability of Radioactive Sources to NIST."

Y-88	1836.1	106.6	4.398E+05	5.002E+03	0.7	1.1	2.6	HPGe

* Master Source refers to Analytics' 8-isotope mixture which is calibrated quarterly.

Calibration Methods: 4π LS - 4 pi Liquid Scintillation Counting, HPGe - High Purity Germanium Gamma-Ray Spectrometer, IC - Ionization Chamber. **Uncertainty:** U - Relative expanded uncertainty, k = 2. See NIST Technical Note 1297, "Guidelines for Evaluating and Expressing the Uncertainty of NIST Measurement Results."

Comments:

215 grams (~140 mL) customer supplied sand.
This standard will expire one year after the calibration date.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

73490-307

RSO#827 Rec'd 8/29/06
JS

215 Grams Sand in Metal Can

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytics maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

Source # 435
rec'd 10-10-96

53012-307

Ra-226 Sand in 3 Inch Can Filled to Capacity

This standard radionuclide source was prepared using an aliquot measured gravimetrically from a master radionuclide solution standard. The master radionuclide solution standard was calibrated by the National Institute of Standards and Technology as SRM 4967. Radionuclide purity and calibration were checked using a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

ISOTOPE:	Ra-226
ACTIVITY (dps):	5702
CALIBRATION DATE:	October 4, 1996 12:00 EST
HALF-LIFE:	1600 years
PERCENT ERROR:	5.0

215.1 grams of sand.

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

ATTD 0144
REC'D 12-12-95

51290-307

Ra-226 Sand in Steel Can

This standard radionuclide source was prepared using an aliquot measured gravimetrically from a calibrated master radionuclide solution source which was calibrated using a germanium gamma spectrometer system. This calibration has been confirmed by the National Institute of Standards and Technology through participation in a Measurements Assurance Program as described in USNRC Reg. Guide 4.15, Revision 1, February 1979.

Radionuclide purity and calibration were checked using a germanium gamma spectrometer system and alpha spectroscopy system. The nuclear decay rate and assay date for this source are given below.

ISOTOPE: Ra-226
ACTIVITY (dps): 3762
HALF-LIFE: 1600 years
CALIBRATION DATE: December 11, 1995 12:00 EST
TOTAL ERROR: 4.9%
SYSTEMATIC ERROR: 3.5%
RANDOM ERROR: 1.4%

215 grams of sand. 2 1/8" OD X 2 7/8" H.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

Source # 435
TCCO 10-10-96

53012-307

Ra-226 Sand in 3 Inch Can Filled to Capacity

This standard radionuclide source was prepared using an aliquot measured gravimetrically from a master radionuclide solution standard. The master radionuclide solution standard was calibrated by the National Institute of Standards and Technology as SRM 4967. Radionuclide purity and calibration were checked using a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

ISOTOPE:	Ra-226
ACTIVITY (dps):	5702
CALIBRATION DATE:	October 4, 1996 12:00 EST
HALF-LIFE:	1600 years
PERCENT ERROR:	5.0

215.1 grams of sand.

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

ATI 120 0144
rec'd 12-12-95

51290-307

Ra-226 Sand in Steel Can

This standard radionuclide source was prepared using an aliquot measured gravimetrically from a calibrated master radionuclide solution source which was calibrated using a germanium gamma spectrometer system. This calibration has been confirmed by the National Institute of Standards and Technology through participation in a Measurements Assurance Program as described in USNRC Reg. Guide 4.15, Revision 1, February 1979.

Radionuclide purity and calibration were checked using a germanium gamma spectrometer system and alpha spectroscopy system. The nuclear decay rate and assay date for this source are given below.

ISOTOPE:	Ra-226
ACTIVITY (dps):	3762
HALF-LIFE:	1600 years
CALIBRATION DATE:	December 11, 1995 12:00 EST
TOTAL ERROR:	4.9%
SYSTEMATIC ERROR:	3.5%
RANDOM ERROR:	1.4%

215 grams of sand. 2 1/8" OD X 2 7/8" H.

CERTIFICATE OF CALIBRATION Standard Radionuclide Source

51290-307

Ra-226 Sand in Steel Can

This standard radionuclide source was prepared using an aliquot measured gravimetrically from a calibrated master radionuclide solution source which was calibrated using a germanium gamma spectrometer system. This calibration has been confirmed by the National Institute of Standards and Technology through participation in a Measurements Assurance Program as described in USNRC Reg. Guide 4.15, Revision 1, February 1979.

Radionuclide purity and calibration were checked using a germanium gamma spectrometer system and alpha spectroscopy system. The nuclear decay rate and assay date for this source are given below.

ISOTOPE:	Ra-226
ACTIVITY (dps):	3762
HALF-LIFE:	1600 years
CALIBRATION DATE:	December 11, 1995 12:00 EST
TOTAL ERROR:	4.9%
SYSTEMATIC ERROR:	3.5%
RANDOM ERROR:	1.4%

215 grams of sand, 2 1/8" OD X 2 7/8" H.

P O NUMBER 51393, Item 1

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

PAI 0720

66354A-307

215 Grams of Sand in Metal Can

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytix maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

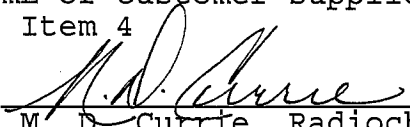

Calibration date: July 1, 2003 12:00 EST

RESUBMISSION

Isotopic Uranium

Case Narrative

Freeport McMoRan Sierrita

FMI-VRP

Work Order Number: 0812177

1. This report consists of the analytical results and supporting documentation for 20 soil samples received by ALS Paragon on 12/17/08.
2. These samples were prepared according to procedures SOP336R0, SOP773R10, and SOP778R12. Due to possible matrix interference, all samples were prepared at a reduced aliquot of ~1 g. Due to high activity detected in the prescreen, samples 0812177-8, -10, -11, -12, and -14 were prepared at a reduced aliquot of ~0.5 g and ~0.25 g for samples -13 and -20.
3. The samples were analyzed for the presence of isotopic uranium according to procedure SOP714R11. The analyses were completed on 02/10/09.
4. The isotopic analysis results for these samples are reported on a 'dry weight' basis in units of pCi/gram.
5. This analytical method quantifies U-235 alpha activity in a specific region of interest corresponding to emission energies between those of U-234 and U-238. A potential limitation of this method is that measurable amounts of U-234 in the sample may cause a small amount of characteristic activity in the U-235 region of interest due to poorly resolved alpha activity at the boundary between the two regions. To minimize the potential for a high bias in the U-235 analytical results, the U-235 region of interest has been narrowed and limited to a lower energy region. An 85.1% abundance correction has been made to the final U-235 results.
6. The requested MDC of 0.1 pCi/gram was not met for U-234 and U-238 for several samples. The reported activity for these samples is greater than the achieved MDC. These samples are identified with an "M3" flag on the final reports.
7. No further anomalous situations were encountered during the preparation or analysis of these samples. All remaining quality control criteria were met.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

80524**CO-US****DEN****XH FTCA****After printing this label:**

1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Comments:

Data Package ID: UR0812177-1

Qualifiers/Flags:

U - Result is less than the sample specific MDC.

LT - Result is less than Requested MDC, greater than sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.

Y2 - Chemical Yield outside default limits.

M - The requested MDC was not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

Abbreviations:

TPU - Total Propagated Uncertainty

MDC - Minimum Detectable Concentration

BDL - Below Detection Limit

QC RESULTS SUMMARY

Isotopic Uranium By Alpha Spectroscopy

PAI 714 Rev 11

Method Blank Results

Lab Name: ALS Paragon

Work Order Number: 0812177

Client Name: Freeport McMoRan Sierrita

ClientProject ID: FMI-VRP

Lab ID: AS090129-1MB

Sample Matrix: SOIL

Prep SOP: PAI 778 Rev 12

Date Collected: 29-Jan-09

Date Prepared: 29-Jan-09

Date Analyzed: 10-Feb-09

Prep Batch: AS090129-1

QCBatchID: AS090129-1-1

Run ID: AS090129-1A

Count Time: 1000 minutes

Final Aliquot: 0.830 g

Result Units: pCi/g

File Name: Spectrum #1

CASNO	Target Nuclide	Result +/- 2 s TPU	MDC	Requested MDC	Lab Qualifier
13966-29-5	U-234	0.015 +/- 0.018	0.028	0.1	U
15117-96-1	U-235	0.010 +/- 0.016	0.027	0.1	U
7440-61-1	U-238	0.0043 +/- 0.019	0.036	0.1	U

Chemical Yield Summary

Carrier/Tracer	Amount Added	Result	Units	Yield	Control Limits	Flag
U-232	5.442	4.59	pCi/g	84.4	30 - 110 %	

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.

Y2 - Chemical Yield outside default limits.

LT - Result is less than Requested MDC, greater than sample specific MDC.

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)

MDC - Minimum Detectable Concentration (see PAI SOP 709)

BDL - Below Detection Limit

M - Requested MDC not met.

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

7440-61-1	U-238	2.3 +/- 0.44	0.029	0.1	

Chemical Yield Summary

Carrier/Tracer	Amount Added	Result	Units	Yield	Control Limits	Flag
U-232	4.412	3.66	pCi/g	83.0	30 - 110 %	

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.

Y2 - Chemical Yield outside default limits.

LT - Result is less than Requested MDC, greater than sample specific MDC.

M - The requested MDC was not met.

M3 - The requested MDC was not met, but thereported activity is greater than the reported MDC.

W - DER is greater than Warning Limit of 1.42

D - DER is greater than Control Limit of 2.13

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)

MDC - Minimum Detectable Concentration (see PAI SOP 709)

BDL - Below Detection Limit

Comments:

Data Package ID: UR0812177-1

Qualifiers/Flags:

- U - Result is less than the sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
- Y2 - Chemical Yield outside default limits.
- W - DER is greater than Warning Limit of 1.42
- D - DER is greater than Control Limit of 2.13
- + - Duplicate RPD not within limits.
- LT - Result is less than Request MDC, greater than sample specific MDC
- * - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- # - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

M - Requested MDC not met.
M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

- L - LCS Recovery below lower control limit.
- H - LCS Recovery above upper control limit.
- P - LCS, Matrix Spike Recovery within control limits.
- N - Matrix Spike Recovery outside control limits
- NC - Not Calculated for duplicate results less than 5 times MDC
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

Notes:

- The Tracer results are not yield corrected (i.e. activity measured not activity added).
- Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:

- TR - Tracer
- TA - Target Analyte
- TPU - Total Propagated Uncertainty
- MDC - Minimum Detectable Concentration
- DER - Duplicate Error Ratio
- BDL - Below Detection Limit

Comments:

Data Package ID: UR0812177-1

Qualifiers/Flags:

- U - Result is less than the sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
- Y2 - Chemical Yield outside default limits.
- W - DER is greater than Warning Limit of 1.42
- D - DER is greater than Control Limit of 2.13
- + - Duplicate RPD not within limits.
- LT - Result is less than Request MDC, greater than sample specific MDC
- * - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- # - Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

M - Requested MDC not met.
M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

- L - LCS Recovery below lower control limit.
- H - LCS Recovery above upper control limit.
- P - LCS, Matrix Spike Recovery within control limits.
- N - Matrix Spike Recovery outside control limits
- NC - Not Calculated for duplicate results less than 5 times MDC
- B - Analyte concentration greater than MDC.
- B3 - Analyte concentration greater than MDC but less than Requested MDC.

Notes:

- The Tracer results are not yield corrected (i.e. activity measured not activity added).
- Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:

- TR - Tracer
- TA - Target Analyte
- TPU - Total Propagated Uncertainty
- MDC - Minimum Detectable Concentration
- DER - Duplicate Error Ratio
- BDL - Below Detection Limit

Comments:

Data Package ID: UR0812177-1

Qualifiers/Flags:

U - Result is less than the sample specific MDC.
Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
Y2 - Chemical Yield outside default limits.
W - DER is greater than Warning Limit of 1.42
D - DER is greater than Control Limit of 2.13
+ - Duplicate RPD not within limits.
LT - Result is less than Request MDC, greater than sample specific MDC
* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

M - Requested MDC not met.
M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

Notes:
1) The Tracer results are not yield corrected (i.e. activity measured not activity added).
2) Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:
TR - Tracer TA - Target Analyte
TPU - Total Propagated Uncertainty
MDC - Minimum Detectable Concentration
DER - Duplicate Error Ratio
BDL - Below Detection Limit

Comments:

Data Package ID: UR0812177-1

Qualifiers/Flags:

- U - Result is less than the sample specific MDC.
Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
Y2 - Chemical Yield outside default limits.
W - DER is greater than Warning Limit of 1.42
D - DER is greater than Control Limit of 2.13
+ - Duplicate RPD not within limits.
LT - Result is less than Request MDC, greater than sample specific MDC
* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

M - Requested MDC not met.
M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

- L - LCS Recovery below lower control limit.
H - LCS Recovery above upper control limit.
P - LCS, Matrix Spike Recovery within control limits.
N - Matrix Spike Recovery outside control limits
NC - Not Calculated for duplicate results less than 5 times MDC
B - Analyte concentration greater than MDC.
B3 - Analyte concentration greater than MDC but less than Requested MDC.

Notes:

- 1) The Tracer results are not yield corrected (i.e. activity measured not activity added).
2) Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:

- TR - Tracer TA - Target Analyte
TPU - Total Propagated Uncertainty
MDC - Minimum Detectable Concentration
DER - Duplicate Error Ratio
BDL - Below Detection Limit

Live Time: 300.00 min.
Real Time: 300.01 min.
Dead Time: 0.00 %

Calibration

Bkgd Info: Sample: B09020313; Det: 13; Spectrum #1; Feb-03-2009 14:40

Calibration Date: 2/3/2009 10:33:09AM

Efficiency Calibration: C09020313

Efficiency: 32.25% +/- 0.13% TPU(2 sigma)

Energy Calibration: C09020313

Energy Cal: Gain = 9.8047 keV / Ch

Offset = 3,026.20 keV

Quadratic = 0.0000 keV / Ch²

Tracer

Tracer Name: 837.3610.11 U-232

Tracer Activity: 20.12 DPM/mL x (Vol.)0.50 mL = 10.06 DPM

Tracer Nuclide: U-232

Tracer Recovery: 63.71%

Comments

Due to a possible matrix interference, all samples were prepped at a reduced aliquot of ~1 g. Due to the high activity detected in prescreen, samples 0812177-8, -10, -11, -12, and -14 were prepped at a reduced aliquot of ~0.5 g. Samples 0812177-13 and -20 were prepped using a ~0.25 g aliquot, due to high activity also. To prevent any Pu bleedthrough, 3 drops of NaNO2 were added to all samples. PEG was applied to all samples.

Standard Reference Material 4321C Natural Uranium Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive natural uranium nitrate and nitric acid dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of alpha-particle counting instruments and for the monitoring of radiochemical procedures.

Radiological Hazard

The SRM ampoule contains uranium-238, uranium-235, and uranium-234 with a total activity of approximately 2600 Bq. Uranium decays by alpha-particle emission. The progeny of uranium-238, uranium-235, and uranium-234 have a total activity of approximately 2600 Bq and decay by alpha- and beta-particle emission. None of the alpha or beta particles escape from the SRM ampoule. During the decay process X-rays and gamma rays with energies from 11 keV to 2.0 MeV are also emitted. Most of these photons escape from the SRM ampoule but their intensities are so small that they do not represent a radiation hazard. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard

The SRM ampoule contains nitric acid (HNO_3) with a concentration of 1 mole per liter of water. The solution is corrosive and represents a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2. The ampoule should be opened only by persons qualified to handle both radioactive material and strong acid solution.

Storage and Handling

The SRM should be stored and used at a temperature between 5 and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least August 2007.

The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) both because of the radioactivity and because of the strong acid.

Preparation

This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, J.M.R. Hutchinson, Group Leader. The overall technical direction and physical measurements leading to certification were provided by L.L. Lucas of the Radioactivity Group.

The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program by N.M. Trahey.

Gaithersburg, Maryland 20899
November 1997

Thomas E. Gills, Chief
Standard Reference Materials Program

Recommended Procedure for Opening the SRM Ampoule

- 1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.
- 2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it. Work in a fume hood. In addition to the radioactive material, the solution contains strong acid and is corrosive.
- 3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.
- 4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.
- 5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.
- 6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.
- 7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.
- 8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.
- 9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss.

See also reference [4]*.

PROPERTIES OF SRM 4321C
(Certified values are shown in bold type)

Source identification number	NIST SRM 4321C

NOTES

- [a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.
 Distance from Ampoule (cm): 1 30 100
 Approximate Dose Rate ($\mu\text{Sv/h}$): <0.1 - -
- [b] The stated uncertainty is two times the standard uncertainty.
- [c] **Massic activity** is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].
- [d] The reported value, y , of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \dots, x_n)$, where f is a mathematical function derived from the assumed model of the measurement process.

The value, x_i , used for each input quantity i has a **standard uncertainty**, $u(x_i)$, that generates a corresponding uncertainty in y , $u_i(y) \equiv |\partial y / \partial x_i| \cdot u(x_i)$, called a **component of combined standard uncertainty** of y .

The **combined standard uncertainty** of y , $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty.

The combined standard uncertainty is multiplied by a **coverage factor** of $k = 2$ to obtain U , the **expanded uncertainty** of y .

Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.

For further information on the expression of uncertainties, see references [2] and [3].

- [e] The value of each standard uncertainty component, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the massic count rate is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).
- [f] Estimated limits of detection for photon-emitting impurities are:
 1.4 $\gamma \cdot \text{s}^{-1} \cdot \text{g}^{-1}$ for energies between 8 and 59 keV,
 1.1 $\gamma \cdot \text{s}^{-1} \cdot \text{g}^{-1}$ for energies between 67 and 88 keV,
 0.5 $\gamma \cdot \text{s}^{-1} \cdot \text{g}^{-1}$ for energies between 102 and 197 keV,
 0.3 $\gamma \cdot \text{s}^{-1} \cdot \text{g}^{-1}$ for energies between 205 and 762 keV,
 0.2 $\gamma \cdot \text{s}^{-1} \cdot \text{g}^{-1}$ for energies between 770 and 996 keV, and
 0.1 $\gamma \cdot \text{s}^{-1} \cdot \text{g}^{-1}$ for energies between 1006 and 1900 keV,
 provided that the photons are separated in energy by 4 keV or more from photons emitted in the decay of uranium-238, uranium-235, uranium-234, or their progeny.
- [g] The stated uncertainty is the standard uncertainty. See reference [5].

- [h] Relative standard uncertainty of the input quantity x_i .
- [i] The relative change in the output quantity y divided by the relative change in the input quantity x_i . If $|\partial y/\partial x_i| \cdot (x_i/y) = 1.0$, then a 1% change in x_i results in a 1% change in y . If $|\partial y/\partial x_i| \cdot (x_i/y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y .
- [j] Relative component of combined standard uncertainty of output quantity y , rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y = |\partial y/\partial x_i| \cdot u(x_i)/y = |\partial y/\partial x_i| \cdot (x_i/y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y/\partial x_i| \cdot (x_i/y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.
- [k] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i = 100\%$. $|\partial y/\partial x_i| \cdot (x_i/y) = \{(\text{response per Bq of impurity})/(\text{response per Bq of U-238})\} \cdot \{(\text{Bq of impurity})/(\text{Bq of U-238})\}$. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

CROSSTALK NOTE: Due to the possibility of tailing from one ROI into another, a known "crosstalk factor" may be applied to the raw count data. In these cases, the estimated number of counts that spill over into the adjacent ROI are arithmetically returned to the ROI of origin. In these cases the crosstalk factor and related information are documented on a QASS, which is referenced on this sheet, if applicable.

Prepare a Working Dilution of 837.3020.72 U-232 at
~ 20 dpm/mL

1) Density calculation of 1M HNO₃ lot # 076081 bal #
 Mass of 100 mL Vol. flask 66.4339g 12
 Mass of Flask and 100 mL Acid 169.1236g 1
 Net Mass of 100 mL Acid 102.6897g
 $\rho = 1.026897 \text{ g/mL}$

2) Mass of Std. Transferred (solid)
 Mass of empty 1000 mL Nalgene 74.7411g 12
 Mass of Nalgene and Std. Transf. 78.0230g 1
 Net Mass of Std. Transferred 3.2819g

3) Dilute to Final Volume
 Mass of Std. bottle diluent 1185.9g 26
 Mass of empty Nalgene 74.7411g 12

Prepare a primary dilution of U-232, ISO #837, by diluting contents (#74682-307) to a final volume of approx 40 ml.

1) Prepare a 1.0 M HNO_3 solution by diluting 63 ml conc HNO_3 , Fischer lot # 065460, in 1 L DI water.

2) Determine density of $\frac{1.0 \text{ M}}{1.0 \text{ M}} \text{HNO}_3$ lot # 065460 (Bal 12)

Mass of 100 ml volumetric flask: 62.4704g

Mass of flask + acid: 165.3413g

Net mass of acid: 102.8709g

$\therefore 100 \text{ ml} = \text{density of } 1.0 \text{ M } \text{HNO}_3 : 1.029 \text{ g/ml}$

3) Transfer contents of vial to a 40 ml VOA vial (Bal 12)

Mass of VOA vial (w/ lid): 24.7623g

Mass of VOA vial + std: 29.9487g

Net mass of std transferred: 5.1864g

4) Dilute with 1.0 M HNO_3 (Bal 12)

Mass of vial + std + acid: 63.2324g

Mass of vial from above: 24.7623g

Net mass of primary std: 38.4701g

5) Final Activity Calculation:

$$\frac{4375 \text{ cps (60 s/min)} (5.1864 \text{ g})}{(5.2465 \text{ g}) (38.4701 \text{ g})} = 6745.123 \text{ dpm/g}$$

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

74682-307

U-232 5 mL Liquid in Flame Sealed Vial

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated by the Department Des Applications Et De La Metrologie Des Rayonnements Ionisants (DAMRI), Paris, France, as Number 23236.

Radionuclide purity and calibration were checked with a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

ISOTOPE:	U-232
ACTIVITY (Bq):	4.375 E3
HALF-LIFE:	68.9 years
CALIBRATION DATE:	March 7, 2007 12:00 EST
RELATIVE EXPANDED UNCERTAINTY (k=2):	5.0%

Impurities: γ -impurities <0.1%
U-233 <0.3%
Am-241 <0.15%

5.24665 grams 1M HNO₃ solution.

CERTIFICATE OF CALIBRATION MIXED ALPHA STANDARD SOURCE

Radionuclide A: U-234
Radionuclide B: U-235
Radionuclide C: Am-241
Half Life (U-234): $(2.454 \pm 0.006)E+05$ years
Half Life (U-235): $(7.037 \pm 0.011)E+08$ years
Half Life (Am-241): 432.17 ± 0.66 years

Customer: PARAGON ANALYTICS, INC.
P.O. No.: EW040203/R2193
Catalog No.: MISC-STD
Reference Date: 1-May-03 12:00 PST
Source No.: 92MIX2203026

Contained Radioactivity:

U-234:	3.354 nCi (124.1 Bq)	Am-241:	0.5793 nCi (21.43 Bq)
U-235:	0.06566 nCi (2.429 Bq)	Total Activity:	3.999 nCi (148.0 Bq)

Physical description:

A. Capsule type:	Disk (22 mm OD X 0.79 mm THK)
B. Nature of active deposit:	Electrodeposited and diffusion bonded oxides
C. Active Diameter:	19 mm
D. Backing:	Stainless steel
E. Cover:	None

Radioimpurities: Not determined

Method of Calibration:

This source was assayed using a windowless internal gas flow proportional counter for total alpha activity. Individual nuclide ratios were taken from those determined in Mar 1998.

Uncertainty of Measurement:

A. Type A (random) uncertainty:	$\pm 0.7\%$
B. Type B (systematic) uncertainty:	$\pm 3.0\%$
C. Uncertainty in aliquot weighing:	$\pm 0.0\%$
D. Total uncertainty at the 99% confidence level:	$\pm 3.1\%$

Notes:

- See reverse side for leak test(s) performed on this source.
- IPL participates in a NIST measurement assurance program to establish and maintain implicit traceability for a number of nuclides, based on the blind assay (and later NIST certification) of Standard Reference Materials (As in NRC Regulatory Guide 4.15).
- Nuclear data was taken from "Table of Radioactive Isotopes", edited by Virginia Shirley, 1986.
- This source has a working life of 2 years.
- This source had a total alpha surface emission rate of 4483 α /min in 2π on 11 Apr 03.

CERTIFICATE OF CALIBRATION MIXED ALPHA STANDARD SOURCE

29

Radionuclide:	U-234	Customer:	PARAGON ANALYTICS, INC.
Radionuclide:	U-235	P.O. No.:	73179/R3768
Radionuclide:	Am-241	Catalog No.:	MISC-STD
Half-life (U-234):	(2.454 ± 0.006)E+05 years	Reference Date:	1-Jun-07 12:00 PST
Half-life (U-235):	(7.037 ± 0.011)E+08 years	Source No.:	92MIX223027
Half-life (Am-241):	432.17 ± 0.66 years		

Contained Radioactivity:

U-234:	1.349	nCi,	49.91	Bq	Am-241:	0.3243	nCi,	12.00	Bq
U-235:	0.02970	nCi,	1.099	Bq	Total Activity:	1.703	nCi,	63.01	Bq

Physical Description:

A. Capsule type:	Disk (47 mm OD x 0.76 mm THK)
B. Nature of active deposit:	Electrodeposited and diffusion bonded oxide
C. Active diameter/volume:	19 mm
D. Backing:	Stainless steel
E. Cover:	None

Radioimpurities: Not determined

Method of Calibration:

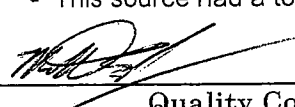

This source was assayed using a windowless internal gas flow proportional counter for total alpha activity. Individual nuclide ratios were taken from those determined in May 2001.

Uncertainty of Measurement:

A. Type A (random) uncertainty:	± 0.9 %
B. Type B (systematic) uncertainty:	± 3.0 %
C. Uncertainty in aliquot weighing:	± 0.0 %
D. Total uncertainty at the 99% confidence level:	± 3.1 %

Notes:

- See reverse side for leak test(s) performed on this source.
- IPL participates in a NIST measurement assurance program to establish and maintain implicit traceability for a number of nuclides, based on the blind assay (and later NIST certification) of Standard Reference Materials (as in NRC Regulatory Guide 4.15).
- Nuclear data was taken from "Table of Radioactive Isotopes", edited by Virginia Shirley, 1986.
- This source has a working life of 2 years.
- This source had a total alpha surface emission rate of 1909 α/min in 2π on 22-May-07

Case Narrative

Freeport McMoRan Sierrita

FMI-VRP

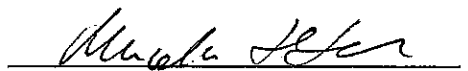

Work Order Number: 0812177

1. This report consists of the analytical results and supporting documentation for thirteen soil samples received by ALS Paragon on 12/17/08.
2. These samples were prepared and analyzed according to procedures SOP783R8. The analyses were completed on 03/12/09.
3. The analysis results for these samples are reported on a 'dry weight' basis in units of pCi/gram.
4. No anomalous situations were encountered during the preparation or analysis of these samples. All quality control criteria were met.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

**After printing this label:**

1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Lab ID:	0812177-19

Sample Matrix: SOIL
Prep SOP: PAI 783 Rev 8
Date Collected: 23-Jul-08
Date Prepared: 03-Feb-09
Date Analyzed: 24-Feb-09

Prep Batch: RE090203-4
QCBatchID: RE090203-4-1
Run ID: RE090203-4A
Count Time: 15 minutes
Report Basis: Dry Weight

Final Aliquot: 1.01 g
Prep Basis: Dry Weight
Moisture(%): NA
Result Units: pCi/g
File Name: Manual Entry

CASNO	Target Nuclide	Result +/- 2 s TPU	MDC	Requested MDC	Lab Qualifier
13982-63-3	Ra-226	1.9 +/- 0.65	0.58	1	

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC.
Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.
Y2 - Chemical Yield outside default limits.
LT - Result is less than Requested MDC, greater than sample specific MDC.
M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.
M - The requested MDC was not met.

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)
MDC - Minimum Detectable Concentration (see PAI SOP 709)
BDL - Below Detection Limit

Data Package ID: RE0812177-1

Comments:

Data Package ID: RE0812177-1

Qualifiers/Flags:

U - Result is less than the sample specific MDC.
Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
Y2 - Chemical Yield outside default limits.
W - DER is greater than Warning Limit of 1.42
D - DER is greater than Control Limit of 2.13
+ - Duplicate RPD not within limits.
LT - Result is less than Request MDC, greater than sample specific MDC
* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

M - Requested MDC not met.
M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.
H - LCS Recovery above upper control limit.
P - LCS, Matrix Spike Recovery within control limits.
N - Matrix Spike Recovery outside control limits
NC - Not Calculated for duplicate results less than 5 times MDC
B - Analyte concentration greater than MDC.
B3 - Analyte concentration greater than MDC but less than Requested MDC.

Notes:

1) The Tracer results are not yield corrected (i.e. activity measured not activity added).
2) Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:

TR- Tracer TA - Target Analyte
TPU - Total Propagated Uncertainty
MDC - Minimum Detectable Concentration
DER - Duplicate Error Ratio
BDL - Below Detection Limit

SRM 4967A
Radium-226

<15 kBq in 4% hydrochloric acid

CAUTION
RADIOACTIVE
MATERIAL

Prepare a primary dilution of RSO
#818 (NIST 4967A) by diluting the
entire stock solution to approx 40 ml
w/ 1M HCl

1) Prepared 2L HCl in 1M solution by
diluting 166 ml conc HCl, Fischer
lot # 060506, in 2L DI water.

2) Determine density of 1M HCl

Mass of 100 ml volumetric flask = 56.4422 g (Bal 12)
Mass of flask + acid = 157.6815 g ↓
Net mass of 1M HCl = 101.2393 g
÷ 100 ml = density of 1M HCl = 1.0124 g/ml.

3) Transfer contents of ampoule to 40 ml VOA vial.

Mass of VOA vial = 24.9938 g (Bal 12)
Mass of vial + std = 29.9415 g ↓
Net mass of std transferred = 4.9477 g

4) Dilute w/ 1M HCl

Mass of vial + std + HCl = 64.9255 g Bal 12
Mass of vial (from above) = 24.9938 g
Net mass of primary std. = 39.9317 g

5) Final Activity Calculation

$$\frac{(2482 \text{ Bq/g})(4.9477 \text{ g})(60 \text{ Bq/dpm})}{(39.9317 \text{ g})} = 18,451.8 \text{ dpm/g}$$

Standard Reference Material 4967A Radium-226 Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive radium-226 chloride (and its radioactive decay products), non-radioactive barium chloride and hydrochloric acid dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of instruments and for the monitoring of radiochemical procedures.

Radiological Hazard: The SRM ampoule contains radium-226 with an activity of approximately 13 kBq. Radium-226 decays by alpha-particle emission. The progeny of radium-226 have a total activity of approximately 95 kBq and decay by alpha- and beta-particle emission. None of the alpha or beta particles escape from the SRM ampoule. During the decay process, X-rays and gamma rays with energies from 11 keV to 2.5 MeV are also emitted. Most of these photons escape from the SRM ampoule and can represent a radiation hazard. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. Gaseous radon-222 will escape from the ampoule when it is opened. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard: The SRM ampoule contains hydrochloric acid (HCl) with a concentration of 1.0 mole per liter of water. The solution is corrosive and represents a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2. The ampoule should be opened only by persons qualified to handle both radioactive material and strong acid solution.

Storage and Handling: The SRM should be stored and used at a temperature between 5 °C and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least September 2013. The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) because of both the radioactivity and the strong acid.

Preparation: This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, M.P. Unterwiesing, Acting Group Leader. The overall technical direction and physical measurements leading to certification were provided by R. Collé and P. Volkovitsky of the Radioactivity Group. Statistical consultation was provided by S.D. Leigh of the NIST Statistical Engineering Division. The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program.

Ionizing Radiation Division

Gaithersburg, Maryland 20899
December 2004

Robert L. Watters, Jr., Chief
Measurement Services Division

Recommended Procedure for Opening the SRM Ampoule

- 1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.
- 2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it. Work in a fume hood. In addition to the radioactive material, the solution usually contains strong acid or base and is corrosive.
- 3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.
- 4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.
- 5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.
- 6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.
- 7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.
- 8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.
- 9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss.

Coverage Factor, k				<u>x 2</u>
Relative Expanded Uncertainty of the Output Quantity, U/y , (%)				1.2

NOTES

- [a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.
 Distance from Ampoule (cm): 1 10 100
 Approximate Dose Rate ($\mu\text{Sv/h}$): 5 0.4
- [b] **Massic activity** is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].
- [c] The reported value, y , of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \dots, x_n)$, where f is a mathematical function derived from the assumed model of the measurement process. The value, x_i , used for each input quantity i has a **standard uncertainty**, $u(x_i)$, that generates a corresponding uncertainty in y , $u_i(y) = |\partial y / \partial x_i| \cdot u(x_i)$, called a **component of combined standard uncertainty** of y . The **combined standard uncertainty** of y , $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty. The combined standard uncertainty is multiplied by a **coverage factor** of $k=2$ to obtain U , the **expanded uncertainty** of y .
- Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.
- For further information on the expression of uncertainties, see references [2] and [3].
- [d] The value of each component of combined standard uncertainty, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the massic response is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).
- [e] The stated uncertainty is two times the standard uncertainty.
- [f] Estimated limits of detection for photon-emitting impurities, as of the reference time, expressed as massic photon emission rates, are:
 $6 \times 10^0 \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 22 and 182 keV,
 $3 \times 10^0 \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 190 and 347 keV,
 $8 \times 10^{-1} \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 356 and 1455 keV, and
 $3 \times 10^{-1} \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 1465 and 2750 keV,
 provided that the photons are separated in energy by 4 keV or more from photons emitted in the decay of radium-226 and progeny.
- [g] The stated uncertainty is the standard uncertainty.

- [h] For further details on NBS/NIST radium series calibrations refer to reference [6]. The 1967 recalibrations of the "1947 series" and of the "1957 series" were made using pressurized "4 π " γ ionization chamber (PIC) "A".

The master solution for SRM 4967A was directly compared with the "1947 (1967 recalibrated) series" of radium-226 solution standards using PIC "A", and was compared with solutions of the "1992 series" of radium solution standards (SRM 4967) using PIC "A", pulse-ionization-chamber radon analyses (see references [7] and [8]), and germanium photon spectrometry.

The radium-226 in SRM 4967A was chemically purified approximately 55 years ago. The lead-210 and its daughter radionuclides are not in equilibrium.

- [i] Relative standard uncertainty of the input quantity x_i .
- [j] The relative change in the output quantity y divided by the relative change in the input quantity x_i . If $|\partial y / \partial x_i| \cdot (x_i / y) = 1.0$, then a 1% change in x_i results in a 1% change in y . If $|\partial y / \partial x_i| \cdot (x_i / y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y .
- [k] Relative component of combined standard uncertainty of output quantity y , rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y \equiv |\partial y / \partial x_i| \cdot u(x_i)/y = |\partial y / \partial x_i| \cdot (x_i / y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y / \partial x_i| \cdot (x_i / y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.
- [m] The relative standard uncertainty of $\lambda \cdot t$ is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainty of t is negligible.
- [n] $|\partial y / \partial x_i| \cdot (x_i / y) = |\lambda \cdot t|$
- [p] The U.S. National Standards for radium-226 are certified in terms of mass of radium-226, as were all radium-226 SRMs prior to the "1992 series". Beginning with the "1992 series", radium-226 solution SRMs are now certified in terms of the massic activity of radium-226.
- [q] The relative standard uncertainty of the activity of radium-226 per unit mass of radium-226 is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainties of the atomic weight of radium-226 and of Avogadro's number are negligible.
- [r] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i = 100\%$. $|\partial y / \partial x_i| \cdot (x_i / y) = \{(\text{response per Bq of impurity})/(\text{response per Bq of Ra-226})\} \cdot \{(\text{Bq of impurity})/(\text{Bq of Ra-226})\}$. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

Prepare a working dilution of 818.3020.31 to a final concentration of approximately 100 dpm/ml.

1) Determine density of 1M HCl: (Lot # 063537) (Bal 12)
 Mass of empty 100 ml Class A flask: 62.4699 g
 Mass of 100 ml Class A glass + 100 ml 1M HCl: 163.9106 g
 Net mass of 1M HCl: 101.4407
 $\div 100 = \text{density} = 1.0144 \text{ g/ml}$

2) Transfer std to 1 L Nalgene bottle: (Bal 12)
 Mass of bottle (w/o lid): 74.2161 g
 Mass of bottle + std: 79.4285 g
 Net mass of std. transferred: 5.4124 g

3) Dilute w 1M HCl (Bal 26)
 Mass of bottle + std + 1M HCl: 1087.3 g
 Mass of bottle (from above): 74.2161 g
 Net mass of std: 1013.0839 g

4) Final Activity Calculation:

$$\frac{5.4124 \text{ g} \times 18451.8 \text{ dpm/g} \times 1.0144 \text{ g/ml}}{1013.0839 \text{ g}} = 99.998 \text{ dpm/ml}$$

5) Std. transferred to Marinelli beaker for verification by γ -spec

Std ID: 818.3020.76

Description: Ra-226

SRM 4967A
Radium-226

<15 kBq in 4% hydrochloric acid

CAUTION
RADIOACTIVE
MATERIAL

Prepare a primary dilution of RSO
#818 (NIST 4967A) by diluting the
entire stock solution to approx 40 ml
w/ 1M HCl

1) Prepared 2L HCl in 1M solution by
diluting 166 mL conc HCl, Fischer
Lot # 060506, in 2L DI water.

2) Determine density of 1M HCl

Mass of 100 mL volumetric flask = 56.4422 g (Bal 12)

Mass of flask + acid = 157.6815 g ↓

Net mass of 1M HCl = 101.2393 g

÷ 100 mL = density of 1M HCl = 1.0124 g/mL

3) Transfer contents of ampoule to 40 mL VOA vial.

Mass of VOA vial = 24.9938 g (Bal 12)

Mass of vial + std = 29.9415 g ↓

Net mass of std transferred = 4.9477 g

4) Dilute w/ 1M HCl

Mass of vial + std + HCl = 64.9255 g Bal 12

Mass of vial (from above) = 24.9938 g

Net mass of primary std. = 39.9317 g

5) Final Activity Calculation

$$\frac{(2482 \text{ Bq/g}) (4.9477 \text{ g}) (60 \text{ Bq/dpm})}{(39.9317 \text{ g})} = 18,451.8 \text{ dpm/g}$$

Standard Reference Material 4967A Radium-226 Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive radium-226 chloride (and its radioactive decay products), non-radioactive barium chloride and hydrochloric acid dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of instruments and for the monitoring of radiochemical procedures.

Radiological Hazard: The SRM ampoule contains radium-226 with an activity of approximately 13 kBq. Radium-226 decays by alpha-particle emission. The progeny of radium-226 have a total activity of approximately 95 kBq and decay by alpha- and beta-particle emission. None of the alpha or beta particles escape from the SRM ampoule. During the decay process, X-rays and gamma rays with energies from 11 keV to 2.5 MeV are also emitted. Most of these photons escape from the SRM ampoule and can represent a radiation hazard. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. Gaseous radon-222 will escape from the ampoule when it is opened. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard: The SRM ampoule contains hydrochloric acid (HCl) with a concentration of 1.0 mole per liter of water. The solution is corrosive and represents a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2. The ampoule should be opened only by persons qualified to handle both radioactive material and strong acid solution.

Storage and Handling: The SRM should be stored and used at a temperature between 5 °C and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least September 2013. The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) because of both the radioactivity and the strong acid.

Preparation: This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, M.P. Unterwieser, Acting Group Leader. The overall technical direction and physical measurements leading to certification were provided by R. Collé and P. Volkovitsky of the Radioactivity Group. Statistical consultation was provided by S.D. Leigh of the NIST Statistical Engineering Division. The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program.

Robert L. Watters, Jr., Chief
Measurement Services Division

Recommended Procedure for Opening the SRM Ampoule

- 1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.
- 2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it. Work in a fume hood. In addition to the radioactive material, the solution usually contains strong acid or base and is corrosive.
- 3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.
- 4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.
- 5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.
- 6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.
- 7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.
- 8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.
- 9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss.

Coverage Factor, k				<u>2</u>
Relative Expanded Uncertainty of the Output Quantity, U/y , (%)				1.2

NOTES

- [a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.
 Distance from Ampoule (cm): 1 10 100
 Approximate Dose Rate ($\mu\text{Sv/h}$): 5 0.4
- [b] **Massic activity** is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].
- [c] The reported value, y , of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \dots, x_n)$, where f is a mathematical function derived from the assumed model of the measurement process. The value, x_i , used for each input quantity i has a **standard uncertainty**, $u(x_i)$, that generates a corresponding uncertainty in y , $u_i(y) = |\partial y / \partial x_i| \cdot u(x_i)$, called a **component of combined standard uncertainty** of y . The **combined standard uncertainty** of y , $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty. The combined standard uncertainty is multiplied by a **coverage factor** of $k=2$ to obtain U , the **expanded uncertainty** of y .
- Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.
- For further information on the expression of uncertainties, see references [2] and [3].
- [d] The value of each component of combined standard uncertainty, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the massic response is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).
- [e] The stated uncertainty is two times the standard uncertainty.
- [f] Estimated limits of detection for photon-emitting impurities, as of the reference time, expressed as massic photon emission rates, are:
 $6 \times 10^0 \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 22 and 182 keV,
 $3 \times 10^0 \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 190 and 347 keV,
 $8 \times 10^{-1} \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 356 and 1455 keV, and
 $3 \times 10^{-1} \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 1465 and 2750 keV,
 provided that the photons are separated in energy by 4 keV or more from photons emitted in the decay of radium-226 and progeny.
- [g] The stated uncertainty is the standard uncertainty.

- [h] For further details on NBS/NIST radium series calibrations refer to reference [6]. The 1967 recalibrations of the "1947 series" and of the "1957 series" were made using pressurized "4 π " γ ionization chamber (PIC) "A".

The master solution for SRM 4967A was directly compared with the "1947 (1967 recalibrated) series" of radium-226 solution standards using PIC "A", and was compared with solutions of the "1992 series" of radium solution standards (SRM 4967) using PIC "A", pulse-ionization-chamber radon analyses (see references [7] and [8]), and germanium photon spectrometry.

The radium-226 in SRM 4967A was chemically purified approximately 55 years ago. The lead-210 and its daughter radionuclides are not in equilibrium.

- [f] Relative standard uncertainty of the input quantity x_i .
- [j] The relative change in the output quantity y divided by the relative change in the input quantity x_i . If $|\partial y/\partial x_i| \cdot (x_i/y) = 1.0$, then a 1% change in x_i results in a 1% change in y . If $|\partial y/\partial x_i| \cdot (x_i/y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y .
- k] Relative component of combined standard uncertainty of output quantity y , rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y = |\partial y/\partial x_i| \cdot u(x_i)/y = |\partial y/\partial x_i| \cdot (x_i/y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y/\partial x_i| \cdot (x_i/y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.
- [m] The relative standard uncertainty of $\lambda \cdot t$ is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainty of t is negligible.
- [n] $|\partial y/\partial x_i| \cdot (x_i/y) = |\lambda \cdot t|$
- [p] The U.S. National Standards for radium-226 are certified in terms of mass of radium-226, as were all radium-226 SRMs prior to the "1992 series". Beginning with the "1992 series", radium-226 solution SRMs are now certified in terms of the massic activity of radium-226.
- [q] The relative standard uncertainty of the activity of radium-226 per unit mass of radium-226 is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainties of the atomic weight of radium-226 and of Avogadro's number are negligible.
- [r] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i = 100\%$. $|\partial y/\partial x_i| \cdot (x_i/y) = \{(\text{response per Bq of impurity})/(\text{response per Bq of Ra-226})\} \cdot \{(\text{Bq of impurity})/(\text{Bq of Ra-226})\}$. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

Prepare a working level dilution of 783.2613.72 to a final concentration of ~100 dpm/mL using 0.1M HCl

① Determine the density of 0.1M HCl

Mass of empty 100mL glass flask: 62.4616g lot # 061842

Mass of flask + 100mL 0.1M HCl: 162.3412g

Net mass of 0.1M HCl: 99.8716g

$\rho = 0.9987 \text{ g/mL}$

Bel
12

② Transfer std to 1L Nalgene

Mass of bottle w/o lid: 74.1318g

Mass of bottle + std: 77.9055g

Net mass of std transferred: 3.8232g

12

③ Dilute w/ 0.1M HCl

Mass of bottle + std + 0.1M HCl: 1097.0g

Mass of bottle (from above): 74.1318g

Net mass of standard: 1022.8682g

26

④ Final Activity Calculation

$$\frac{(27768.35 \text{ dpm/mL})(3.8232 \text{ g})(0.9987 \text{ g/mL})}{(0.9982 \text{ g/mL})(1022.8682 \text{ g})} = 103.84 \text{ dpm/mL}$$

* Note the density of 783.2613.72 is 0.9982 g/mL

Std ID: 783.3020.77

PREPARE A PRIMARY DILUTION OF RSO# 783 BY DILUTING TO 40 ml WITH 0.1 M HCl.

1. DETERMINE DENSITY OF 0.1 M HCl

MASS OF CLASS A VOLUMETRIC FLASK (100 ml): 68.6008 g Bal 12

MASS OF FLASK + 100 ml 0.1 M HCl: 168.4208 g

NET MASS OF 0.1 M HCl: 99.82 g

LOT# 44042

$\rho = 0.9982 \text{ g/ml}$

2. TRANSFER CONTENTS OF AMPULE - RSO# 783 TO A 40 ml VOA VIAL

MASS OF EMPTY 40 ml VOA VIAL w/o LID: 21.4763 g Bal 12

MASS OF OPEN AMPULE + 50 ml BEAKER: 37.8692 g

MASS OF EMPTY AMPULE + 50 ml BEAKER: 32.9096 g

NET MASS OF STD. TRANSFERRED: 4.9596 g

3. FINAL DILUTION WITH 0.1 M HCl

MASS OF EMPTY 40 ml VOA VIAL w/o LID (FROM ABOVE): 21.4763 g Bal 12

MASS OF VIAL + STD + 0.1 M HCl: 61.4738 g

NET MASS OF STD + 0.1 M HCl: 39.9975 g

4. FINAL ACTIVITY CALCULATION

$$\frac{(1.877 \times 10^4 \text{ dps}) (60 \text{ dpm/dps}) (4.9596 \text{ g}) (0.9982 \text{ g/ml})}{(5.01992 \text{ g}) (39.9975 \text{ g})} = 27,768.3514 \text{ dpm/ml}$$

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

70034-307

Ra-226 5 mL Liquid in Flame Sealed Vial

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated using a germanium gamma spectrometer system.

Radionuclide purity and calibration were checked with a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

Analytics maintains traceability to the National Institute of Standards and Technology through participation in a Measurements Assurance Program as described in USNRC Reg. Guide 4.15, Revision 1, February 1979.

ISOTOPE:	Ra-226
ACTIVITY (dps):	1.877 E4
HALF-LIFE:	1.600 E3 years
CALIBRATION DATE:	January 28, 2005 12:00 EST
RELATIVE EXPANDED UNCERTAINTY (k=2):	3.3%

Impurities: γ -impurities (other than decay products) <0.1%

5.01992 grams 0.1M HCl solution with 50 μ g/g Ba carrier.

CERTIFICATE OF CALIBRATION Standard Radionuclide Source

73487-307

RSO# 824 Rec'd 8/29/06
JUB

1.0 Solid in 138G GA-MA Beaker

This standard radionuclide source was prepared using aliquots measured gravimetrically from master radionuclide solution sources. The Am-241 was calibrated by 4 pi alpha liquid scintillation counting. All other radionuclides were calibrated using a germanium gamma spectrometer system. Calibration and purity were checked using a germanium gamma spectrometer system. At the time of calibration no interfering gamma-ray emitting impurities were detected. The gamma-ray emission rates for the most intense gamma-ray lines are given. Analytisc maintains traceability to the National Institute of Standards and Technology through a Measurements Assurance Program as described in USNRC Regulatory Guide 4.15, Rev. 1, February, 1979.

US Patent 4,430,258; UK Patent GB2,149,194B; CA Patent 1,196,776.
Density of solid matrix 1.15 g/cc.

Calibration date: July 1, 2006 12:00 EST

Sample ID: 0613004-6 GEO 1 EFF CAL (824)

Stds. Match Tolerance: 2.00 keV

Detector Number: 06 Calibration Date: . . 09/11/2006 10:06:11

Geometry File (D06) (Sh01).EFF ID. Geo 1 Eff Cal

Amount of Std. in Calib. Source: 1.000000 gm

Crossover: 180.00 keV

Below Crossover Efficiency Fit:

Eff = $10^{[-2.87e+01 + 2.52e+01*En + -5.85e+00*En^2 + 0.00e+00*En^3]}$

(Where En = LOG(Energy in keV)) (Polynomial)

Above Knee Efficiency Fit:

Eff = $10^{[-1.40e+00 + 1.00e+00*En + -6.55e-01*En^2 + 7.72e-02*En^3]}$

(Where En = LOG(Energy in keV)) (Polynomial)

QUALITY ASSURANCE SUMMARY SHEET

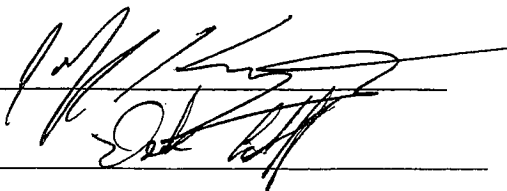

PAR W.O. # / BATCH REM Calibration
TEST REM
METHOD Analysis
SOP/REV (PREP) —
SOP/REV (ANAL) 78328

Briefly document any QA or other problems or deviations associated with the analysis of samples. Problems could result from: log-in, color, odor, dilution, consistency, scheduling, equipment, or instrumentation, or may include documentation of minor deviations necessary due to unique DQO's or sample characteristics.

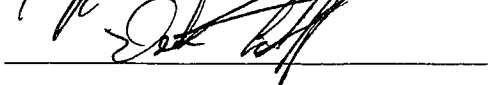

- 92K 2/11/09*
- The radiometric recoveries of the initial calibration verifications for cells 10, 12, and 28 were below the lower control limit of 67%. It was noted that there was an elevated background for these cells and it is believed that this is due to an incomplete purge of the cell after the previous calibration count. The cells were re-purged and the ICV's were re-run. The second analysis is to be used as the initial calibration verification for these cells. *92K 2/11/09*

Standard Reference Material 4967A Radium-226 Radioactivity Standard

This Standard Reference Material (SRM) consists of radioactive radium-226 chloride (and its radioactive decay products), non-radioactive barium chloride and hydrochloric acid dissolved in 5 mL of distilled water. The solution is contained in a flame-sealed NIST borosilicate-glass ampoule. The SRM is intended for the calibration of instruments and for the monitoring of radiochemical procedures.

Radiological Hazard: The SRM ampoule contains radium-226 with an activity of approximately 13 kBq. Radium-226 decays by alpha-particle emission. The progeny of radium-226 have a total activity of approximately 95 kBq and decay by alpha- and beta-particle emission. None of the alpha or beta particles escape from the SRM ampoule. During the decay process, X-rays and gamma rays with energies from 11 keV to 2.5 MeV are also emitted. Most of these photons escape from the SRM ampoule and can represent a radiation hazard. Approximate unshielded dose rates at several distances (as of the reference time) are given in note [a]*. Gaseous radon-222 will escape from the ampoule when it is opened. The SRM should be used only by persons qualified to handle radioactive material.

Chemical Hazard: The SRM ampoule contains hydrochloric acid (HCl) with a concentration of 1.0 mole per liter of water. The solution is corrosive and represents a health hazard if it comes in contact with eyes or skin. If the ampoule is to be opened to transfer the solution, the recommended procedure is given on page 2. The ampoule should be opened only by persons qualified to handle both radioactive material and strong acid solution.

Storage and Handling: The SRM should be stored and used at a temperature between 5 °C and 65 °C. The solution in an unopened ampoule should remain stable and homogeneous until at least September 2013. The ampoule (or any subsequent container) should always be clearly marked as containing radioactive material. If the ampoule is transported it should be packed, marked, labeled, and shipped in accordance with the applicable national, international, and carrier regulations. The solution in the ampoule is a dangerous good (hazardous material) because of both the radioactivity and the strong acid.

Preparation: This Standard Reference Material was prepared in the Physics Laboratory, Ionizing Radiation Division, Radioactivity Group, M.P. Unterwiesing, Acting Group Leader. The overall technical direction and physical measurements leading to certification were provided by R. Collé and P. Volkovitsky of the Radioactivity Group. Statistical consultation was provided by S.D. Leigh of the NIST Statistical Engineering Division. The support aspects involved in the preparation, certification, and issuance of this SRM were coordinated through the Standard Reference Materials Program.

Measurement Services Division

Recommended Procedure for Opening the SRM Ampoule

- 1) If the SRM solution is to be diluted, it is recommended that the diluting solution have a composition comparable to that of the SRM solution.
- 2) Wear eye protection, gloves, and protective clothing and work over a tray with absorbent paper in it. Work in a fume hood. In addition to the radioactive material, the solution usually contains strong acid or base and is corrosive.
- 3) Shake the ampoule to wet all of the inside surface of the ampoule. Return the ampoule to the upright position.
- 4) Check that all of the liquid has drained out of the neck of the ampoule. If necessary, gently tap the neck to speed the process.
- 5) Holding the ampoule upright, score the narrowest part of the neck with a scribe or diamond pencil.
- 6) Lightly wet the scored line. This reduces the crack propagation velocity and makes for a cleaner break.
- 7) Hold the ampoule upright with a paper towel, a wiper, or a support jig. Position the scored line away from you. Using a paper towel or wiper to avoid contamination, snap off the top of the ampoule by pressing the narrowest part of the neck away from you while pulling the tip of the ampoule towards you.
- 8) Transfer the solution from the ampoule using a pycnometer or a pipet with dispenser handle. NEVER PIPETTE BY MOUTH.
- 9) Seal any unused SRM solution in a flame-sealed glass ampoule, if possible, to minimize the evaporation loss.

NOTES

- [a] The Sievert is the SI unit for dose equivalent. See reference [1]. One μSv is equal to 0.1 mrem.
- | | | | |
|---|---|-----|-----|
| Distance from Ampoule (cm): | 1 | 10 | 100 |
| Approximate Dose Rate ($\mu\text{Sv/h}$): | 5 | 0.4 | - |
- [b] **Massic activity** is the preferred name for the quantity activity divided by the total mass of the sample. See reference [1].
- [c] The reported value, y , of massic activity (activity per unit mass) at the reference time was not measured directly but was derived from measurements and calculations of other quantities. This can be expressed as $y = f(x_1, x_2, x_3, \dots, x_n)$, where f is a mathematical function derived from the assumed model of the measurement process. The value, x_i , used for each input quantity i has a **standard uncertainty**, $u(x_i)$, that generates a corresponding uncertainty in y , $u_i(y) = |\partial y / \partial x_i| \cdot u(x_i)$, called a **component of combined standard uncertainty** of y . The **combined standard uncertainty** of y , $u_c(y)$, is the positive square root of the sum of the squares of the components of combined standard uncertainty. The combined standard uncertainty is multiplied by a **coverage factor** of $k=2$ to obtain U , the **expanded uncertainty** of y .
- Since it can be assumed that the possible estimated values of the massic activity are approximately normally distributed with approximate standard deviation $u_c(y)$, the unknown value of the massic activity is believed to lie in the interval $y \pm U$ with a level of confidence of approximately 95 percent.
- For further information on the expression of uncertainties, see references [2] and [3].
- [d] The value of each component of combined standard uncertainty, and hence the value of the expanded uncertainty itself, is a best estimate based upon all available information, but is only approximately known. That is to say, the "uncertainty of the uncertainty" is large and not well known. This is true for uncertainties evaluated by statistical methods (e.g., the relative standard deviation of the standard deviation of the mean for the massic response is approximately 50%) and for uncertainties evaluated by other methods (which could easily be over estimated or under estimated by substantial amounts). The unknown value of the expanded uncertainty is believed to lie in the interval $U/2$ to $2U$ (i.e., within a factor of 2 of the estimated value).
- [e] The stated uncertainty is two times the standard uncertainty.
- [f] Estimated limits of detection for photon-emitting impurities, as of the reference time, expressed as massic photon emission rates, are:
- $6 \times 10^0 \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 22 and 182 keV,
 - $3 \times 10^0 \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 190 and 347 keV,
 - $8 \times 10^{-1} \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 356 and 1455 keV, and
 - $3 \times 10^{-1} \text{ s}^{-1} \cdot \text{g}^{-1}$ for energies between 1465 and 2750 keV,
- provided that the photons are separated in energy by 4 keV or more from photons emitted in the decay of radium-226 and progeny.
- [g] The stated uncertainty is the standard uncertainty.

- [h] For further details on NBS/NIST radium series calibrations refer to reference [6]. The 1967 recalibrations of the "1947 series" and of the "1957 series" were made using pressurized "4 π " γ ionization chamber (PIC) "A".

The master solution for SRM 4967A was directly compared with the "1947 (1967 recalibrated) series" of radium-226 solution standards using PIC "A", and was compared with solutions of the "1992 series" of radium solution standards (SRM 4967) using PIC "A", pulse-ionization-chamber radon analyses (see references [7] and [8]), and germanium photon spectrometry.

The radium-226 in SRM 4967A was chemically purified approximately 55 years ago. The lead-210 and its daughter radionuclides are not in equilibrium.

- [i] Relative standard uncertainty of the input quantity x_i .
- [j] The relative change in the output quantity y divided by the relative change in the input quantity x_i . If $|\partial y / \partial x_i| \cdot (x_i / y) = 1.0$, then a 1% change in x_i results in a 1% change in y . If $|\partial y / \partial x_i| \cdot (x_i / y) = 0.05$, then a 1% change in x_i results in a 0.05% change in y .
- [k] Relative component of combined standard uncertainty of output quantity y , rounded to two significant figures or less. The relative component of combined standard uncertainty of y is given by $u_i(y)/y \approx |\partial y / \partial x_i| \cdot u(x_i)/y = |\partial y / \partial x_i| \cdot (x_i / y) \cdot u(x_i)/x_i$. The numerical values of $u(x_i)/x_i$, $|\partial y / \partial x_i| \cdot (x_i / y)$, and $u_i(y)/y$, all dimensionless quantities, are listed in columns 3, 4, and 5, respectively. Thus, the value in column 5 is equal to the value in column 4 multiplied by the value in column 3. The input quantities are independent, or very nearly so. Hence the covariances are zero or negligible.
- [m] The relative standard uncertainty of $\lambda \cdot t$ is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainty of t is negligible.
- [n] $|\partial y / \partial x_i| \cdot (x_i / y) = |\lambda \cdot t|$
- [p] The U.S. National Standards for radium-226 are certified in terms of mass of radium-226, as were all radium-226 SRMs prior to the "1992 series". Beginning with the "1992 series", radium-226 solution SRMs are now certified in terms of the massic activity of radium-226.
- [q] The relative standard uncertainty of the activity of radium-226 per unit mass of radium-226 is determined by the relative standard uncertainty of λ (i.e., of the half life). The relative standard uncertainties of the atomic weight of radium-226 and of Avogadro's number are negligible.
- [r] The standard uncertainty for each undetected impurity that might reasonably be expected to be present is estimated to be equal to the estimated limit of detection for that impurity, i.e. $u(x_i)/x_i = 100\%$. $|\partial y / \partial x_i| \cdot (x_i / y) = \{(\text{response per Bq of impurity})/(\text{response per Bq of Ra-226})\} \cdot \{(\text{Bq of impurity})/(\text{Bq of Ra-226})\}$. Thus $u_i(y)/y$ is the relative change in y if the impurity were present with a massic activity equal to the estimated limit of detection.

ICV

Cell 24 Detector C

818.3020.76

Spike Amount: 1mL

Activity: 100dpm

Ref. Date: 9-11-03

Spike Date: 10-22-07

Ty₂ = 1600y

ti = 1956d; 5.355y

Decay Corrected Activity

$$A_{dc} = \left[e^{(\ln 0.5) \times (t_i / t_{1/2})} \right] \times 100 = 99.7715 \text{ dpm/mL}$$

$$A_{dc} = 45.35 \text{ pCi/mL}$$

Activity

$$A_{ct} = \frac{G_{cpm} - \text{Calb. cpm}}{k}$$

$$A_{ct} = \frac{178.533}{4.1218}$$

$$A_{ct} = 43.31 \text{ pCi/mL}$$

$$k = (A+B) \times C \times K \times L$$

$$A = 1.9359$$

$$B = 0$$

$$C = 0.9678$$

$$L = 1$$

$$K = 2.2$$

$$G_{cpm} = 182.133$$

$$\text{Calb. cpm} = 3.60$$

Radiometric Recovery

$$\frac{A_{ct}}{A_{dc}} = \frac{43.31}{45.35} = 95.56\%$$

$$\% \text{ diff} = 0.04$$

REF.PO# 65-1924

Certificate of Calibration

(Alpha Sources)

The Thorium 230 alpha source was measured in a proportional counter using P-10 as counting gas. The alpha emissions from the surface of the source were measured at its plateau voltage to determine its 2pi cpm rate. Corrections were applied for background, coincidence loss and backscatter factors when applicable. The source is referenced to NIST 90TH4704627A used in establishing traceability.

Active Diameter(or area) 44mm

Mounting Material SS

Total Diameter(or area) 47mm

Thickness 0.79mm

9,150 cpm

± 460 cpm 2pi

18,000 dpm

± 900 dpm 4pi

0.00812 microcurie

08/20/92 date of measurement

92TH4703015 source serial number

Michael A. Ortiz

Calibration Manager

Charles L. Gonzales

Q.A. Manager

The total uncertainty of the measurement at the 99% confidence interval is 5.0 percent.

RESUBMISSION

Radium-228

Case Narrative

Freeport McMoRan Sierrita

FMI-VRP

Work Order Number: 0812177

1. This report consists of the analytical results and supporting documentation for one soil sample received by ALS Paragon on 12/17/08.
 2. This sample was prepared according to SW-846 Method 9320, SOP746R8. Procedure 9320 was modified as follows: The chemical yield was determined by ICP-AES measurement of the pre and post separation concentration of Ba and Y in these samples.
 3. The sample was analyzed for the presence of ^{228}Ra by low background gas flow proportional counting of ^{228}Ac , which is the ingrown progeny of ^{228}Ra , according to SOP 724R10. The analysis was completed on 01/29/09.
 4. The analysis results for this sample are reported on a 'dry weight' basis in units of pCi/gram.
 5. Method 9320 makes no reference to the analysis of soil samples. The soil samples from this work order were initially leached in concentrated nitric acid. The leachate was then processed as a water sample according to the method.
 6. ICP-AES measurement of barium concentrations prior to chemical separation for sample 0812177-13 showed concentrations less than the amount known to have been added to the sample in the form of barium carrier. To avoid a low bias in the final analytical results the known concentration of the carrier was used in chemical yield calculations in lieu of the pre-separation measurement.
-
1. No further anomalous situations were noted during the preparation and analysis of this sample. All quality control criteria were met.

The data contained in the following report have been reviewed and approved by the personnel listed below. In addition, ALS certifies that the analyses reported herein are true, complete and correct within the limits of the methods employed.

**After printing this label:**

1. Use the 'Print' button on this page to print your label to your laser or inkjet printer.
2. Fold the printed page along the horizontal line.
3. Place label in shipping pouch and affix it to your shipment so that the barcode portion of the label can be read and scanned.

Warning: Use only the printed original label for shipping. Using a photocopy of this label for shipping purposes is fraudulent and could result in additional billing charges, along with the cancellation of your FedEx account number.

Use of this system constitutes your agreement to the service conditions in the current FedEx Service Guide, available on fedex.com. FedEx will not be responsible for any claim in excess of \$100 per package, whether the result of loss, damage, delay, non-delivery, misdelivery, or misinformation, unless you declare a higher value, pay an additional charge, document your actual loss and file a timely claim. Limitations found in the current FedEx Service Guide apply. Your right to recover from FedEx for any loss, including intrinsic value of the package, loss of sales, income interest, profit, attorney's fees, costs, and other forms of damage whether direct, incidental, consequential, or special is limited to the greater of \$100 or the authorized declared value. Recovery cannot exceed actual documented loss. Maximum for items of extraordinary value is \$500, e.g. jewelry, precious metals, negotiable instruments and other items listed in our Service Guide. Written claims must be filed within strict time limits, see current FedEx Service Guide.

Lab Sample ID	Client Sample ID	Sample Type	Nuclide	Result +/- 2 s TPU	MDC	Units	Matrix	Prep Batch	Date Analyzed	Flags
0812177-13	CP-P07-5-7	Sample	Ra-228	3.5 +/- 1.8	2.8	pCi/g	SOIL	RA090120-2	1/29/2009	LT

Comments:

Data Package ID: RA0812177-1

Qualifiers/Flags:

- U - Result is less than the sample specific MDC.
- LT - Result is less than Requested MDC, greater than sample specific MDC.
- Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.
- Y2 - Chemical Yield outside default limits.
- M - The requested MDC was not met.
- M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

Abbreviations:

- TPU - Total Propagated Uncertainty
- MDC - Minimum Detectable Concentration
- BDL - Below Detection Limit

Chemical Yield Summary

Carrier/Tracer	Amount Added	Result	Units	Yield	Control Limits	Flag
BARIUM	35480	32600	ug	91.9	40 - 110 %	
YTTRIUM	8713	5400	ug	61.9	40 - 110 %	
Total				56.9	40 - 110 %	

Comments:

Qualifiers/Flags:

U - Result is less than the sample specific MDC.

Y1 - Chemical Yield is in control at 100-110%. Quantitative Yield is assumed.

Y2 - Chemical Yield outside default limits.

LT - Result is less than Requested MDC, greater than sample specific MDC.

Abbreviations:

TPU - Total Propagated Uncertainty (see PAI SOP 743)

MDC - Minimum Detectable Concentration (see PAI SOP 709)

BDL - Below Detection Limit

M - Requested MDC not met.

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Comments:

Data Package ID: RA0812177-1

Qualifiers/Flags:

U - Result is less than the sample specific MDC.
Y1 - Chemical Yield is in control at 100-110%. Quantitative yield is assumed.
Y2 - Chemical Yield outside default limits.
W - DER is greater than Warning Limit of 1.42
D - DER is greater than Control Limit of 2.13
+ - Duplicate RPD not within limits.
LT - Result is less than Request MDC, greater than sample specific MDC
* - Aliquot Basis is 'As Received' while the Report Basis is 'Dry Weight'.
- Aliquot Basis is 'Dry Weight' while the Report Basis is 'As Received'.

M - Requested MDC not met.

M3 - The requested MDC was not met, but the reported activity is greater than the reported MDC.

L - LCS Recovery below lower control limit.

H - LCS Recovery above upper control limit.

P - LCS, Matrix Spike Recovery within control limits.

N - Matrix Spike Recovery outside control limits

NC - Not Calculated for duplicate results less than 5 times MDC

B - Analyte concentration greater than MDC.

B3 - Analyte concentration greater than MDC but less than Requested MDC.

Notes:

1) The Tracer results are not yield corrected (i.e. activity measured not activity added).
2) Where sample time is not available, 12:00 PM (Mountain) is used for decay correction.

Abbreviations:

TR- Tracer TA - Target Analyte

TPU - Total Propagated Uncertainty

MDC - Minimum Detectable Concentration

DER - Duplicate Error Ratio

BDL - Below Detection Limit

Standards DB Version: 1.091

Prepare approx 1 l of Ra-228 at a working dilution of approx 50 dpm/ml, in 0.1 M HCl (Fisher Lot 060506)

1) Determine density of 0.1 M HCl

Mass of 100 ml "class A" flask = 62.4713 g Bal 12
flask + 0.1 M HCl = 162.3059 g
Net mass of 100 ml 0.1 M HCl = 99.8346 g
 $\div 100 \text{ ml}$ density = 0.9983 g/ml

2) Transfer approx 2 ml 784.3020.37 to 1 l Nalgene bottle.

Mass of bottle w/o lid = 75.0497 g Bal 12
bottle + std = 77.5697 g
Net mass of std = 2.5200 g

3) Dilute w/ 0.1 M HCl

Mass of bottle w/o lid (from above) 75.0497 g
bottle + diluted std = 1073.4 g (Bal 26)
998.4 g

4) Final Activity Calc.

$$\frac{(33,589.8 \text{ dpm/g}) (2.5200 \text{ g}) (0.9983 \text{ g/ml})}{(998.4 \text{ g})} = 84.6378 \text{ dpm/ml}$$

Prepare a primary dilution of (Analytical SRS 70035-30.7)
 RSO # 784 by diluting contents to approx 40g
 w/ 0.1 M HCl in a 40 ml VOA vial.

1) Prepare 2L 0.1 M HCl by diluting 83 ml conc. HCl, Fischer
 lot # 060506, in 2L DI water.

2) Transfer contents of ampoule to 40 ml VOA vial.
 mass of VOA vial w/ lid = 24.9925g (Bal 12)
 vial + STD 784 = 29.7652g
 net std transferal = 4.7727g

3) Dilute w/ 0.1 M HCl
 mass of vial (from above) = 24.9925g
 vial + std + 0.1 M HCl = 64.2671g (Bal 12)
 net mass of std = 39.2746g

4) Final Activity Calc.

$$\frac{(2.308 \times 10^4 \text{ dpm}) (60 \frac{\text{dpm}}{\text{g}}) (4.7727 \text{ g})}{(5.00994 \text{ g}) (39.2746 \text{ g})} = 33,589.8 \frac{\text{dpm}}{\text{g}}$$

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

70035-307

Ra-228 5 mL Liquid in Flame Sealed Vial

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated using a germanium gamma spectrometer system.

Radionuclide purity and calibration were checked with a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

ISOTOPE:	Ra-228
ACTIVITY (dps):	2.308 E4
HALF-LIFE:	5.75 years
CALIBRATION DATE:	January 28, 2005 12:00 EST
RELATIVE EXPANDED UNCERTAINTY (k=2):	3.3%

Impurities: γ -impurities (other than decay products) <0.1%

5.00994 grams 0.1M HCl solution with 25 μ g/g Ba carrier.

 METHOD GFPC
 SOP/REV (PREP) -
 SOP/REV (ANAL) 724

Briefly document any QA or other problems or deviations associated with the analysis of samples. Problems could result from: log-in, color, odor, dilution, consistency, scheduling, equipment, or instrumentation, or may include documentation of minor deviations necessary due to unique DQO's or sample characteristics.

Daily Background Checks are not necessary, and therefore not performed, the day following the Weekly Background Calibration. The results of the Weekly Background Calibration will be used as that day's Daily Background Check. If the Weekly Background Calibration is outside the established control limits for a detector, the Weekly Background Calibration will be performed a second time and will be considered as the second Daily Background Check for that day.

Optimum alpha beta simultaneous operating voltage: **1435**

Optimum alpha only operating voltage: **1195**

	C1	C2	C3	C4
Beta slope at beta voltage	1.87%	0.33%	1.16%	1.31%
Alpha slope at beta voltage	0.84%	-0.50%	1.55%	0.58%
Alpha slope at alpha voltage	2.46%	2.31%	1.43%	0.91%

9/18/07 LSD	<u>Plateaus For Drawers A and B</u>		
	<u>Source Used B</u>	<u>Detector</u>	<u>Source used</u>
	Sr/Y 90 - 406	A1 B1	410 - Am 241
	29,600 dpm - 407	A2 B2	411 - 17,800 dpm
	9/15/92 - 408	A3 B3	412 - 2/06/95
	↓ - 409	A4 B4	413 - ↓
	<u>Parameters</u>	<u>File names:</u>	
	Starting Voltage - 700	PTA0918A	
	Ending Voltage - 1650	PTA0918B	
	30 Volts / step		
	5 min / step		
	40,000 count preset		
9/18/07 LSD	A working voltage could not be found for Drawer B. Another plateau will be run using the same sources as above but different parameters.		
	<u>Parameters</u>	<u>File name:</u>	
	Starting Voltage: 700	PTA0919B	
	Ending Voltage: 1650		
	15 Volts / step		
	5 min / step		
	60,000 count preset		
9/20/07 LSD	A working voltage could still not be found. Technical consultant Mr. Burns Dave Burns suggested setting all the ROIs at 50% before running a plateau.		
	<u>Parameters</u>	<u>Filename:</u>	
	Starting Voltage: 700	PTA0920B	
	Ending Voltage: 1650		
	30 Volts / step		
	5 min / step		
9/20/07 LSD	50,000 ct. preset

9/24/07
 100 A working voltage could still not be found. It was assumed that the count preset was what governed how many counts were being recorded. Turns out that the plateau file was only gathering the counts for 5 minutes and not trying to hit the count preset. This was remedied by increasing the minutes per step to 15 minutes instead of 5 minutes. Two separate plateaus were run (Separates alpha & beta ones) on 9/21/07 and 9/22/07.

Parameters

Starting Voltage: 300
 Ending Voltage: 1800
 15 Volts per step
 15 min per step
 50000 Count preset

File names:

10/6/2008	Efficiency 2007	Efficiency 2008	% Diff
Det #			
A1	0.4175	0.4244	1.65
A2	0.4080	0.4185	2.57
A3	0.4124	0.4168	1.07
A4	0.4232	0.4119	2.67
C1	0.4139	0.4367	5.51
C2	0.4323	0.4558	5.44
C3	0.4360	0.4400	0.92
C4	0.4456	0.4321	3.03

NOTE: Paragon Analytics SOP724R10 states that efficiency calibrations must be within 5 % of the previous calibration values. Prior to the current calibration, the controller for Drawers C and D had a catastrophic failure and was removed from service. The detectors for Drawer C were recalibrated on 10/01/08 and Detector C1 and C2 showed a new counting efficiency slightly more than 5% of the previous efficiency. All calibration and sample data is believed to be unaffected and will be used without further qualification.

JDD 6/24/08

Prepare a working dilution of ~~RSO# 865~~ at $\sim 10,000$ dpm
~~RSO# 865.3610.07~~
 JDD 6/24/08

1) Density of 0.1 M HCl lot #068438 balance
 Mass of 100 ml volumetric flask 68.2945 g 12
 Mass of flask + 100 ml Acid 168.0504 g 12
 Net Mass of Acid ~~99.7554 g~~ 99.7509 g
~~JDD 7/10/08 $\rho = 0.997554 \text{ g/ml}$~~
~~0.997554 g/ml~~

2) Transfer Std.
 Mass of empty vial (No lid) 21.6922 g 12
 Mass of vial + std. Transferred 34.6989 g 12
 Net Mass of Std. Transferred 13.0067 g

3) Dilute w/ 0.1 M HCl
 Mass of Std, diluent, and vial 60.7240 g 12
 Mass of Vial 21.6922 g 12
 Net Mass of Dilution 39.0318 g

Activity Calculation

$$\left(30462.32 \frac{\text{dpm}}{\text{g}} \right) \left(13.0067 \text{ g} \right) \left(\frac{0.997509 \text{ g/ml}}{39.0318 \text{ g}} \right) = 10125.80 \frac{\text{dpm}}{\text{ml}}$$

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

77540-307

Sr-89 50 mL Liquid in Flame Sealed Vial

Customer: Paragon Analytics
P. O. No.: 73625, Item 1

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated by liquid scintillation counting.

Radionuclide purity and calibration were checked by germanium gamma-ray spectrometry and liquid scintillation counting. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

Isotope:	Sr-89
Activity (Bq):	2.557 E4
Half-Life:	50.53 days
Calibration Date:	June 9, 2008 12:00 EST
Relative Expanded Uncertainty (k=2):	1.7 %

Comments:

Impurities: γ -impurities <0.1%
50.36376 grams 0.1M HCl solution with 30 $\mu\text{g/g}$ Sr carrier.

PROJECT

784.3020.38 Ra-228

Notebook No. _____

Continued From Page _____

Prepare approx 1L of Ra-228 at a working dilution of approx 50 dpm/ml, in 0.1 M HCl (Fischer Lot 060506)

1) Determine density of 0.1 M HCl

Mass of 100ml "class A" flask = 62.4713g Bal 12
flask + 0.1 M HCl = 162.3059g
Net mass of 100ml 0.1 M HCl = 99.8346g
÷ 100 ml density = 0.9983 g/ml

2) Transfer approx 2 ml 784.3020.37 to 1L Nalgene bottle.

Mass of bottle w/ lid = 75.0497g Bal 12
bottle + std = 77.5697g
Net mass of std = 2.5200g

3) Dilute w/ 0.1 M HCl

Mass of bottle w/ lid (from above) 75.0497g
bottle + diluted std = 1073.4g (Bal 26)
998.4 g

4) Final Activity Calc.

$$\frac{(33,589.8 \text{ dpm/g})(2.5200 \text{ g})(0.9983 \text{ g/ml})}{(998.4 \text{ g})} = 84.6378 \text{ dpm}$$

Std ID: 784.3020.38

Prepare a primary dilution of (Analytical SRS 70035-307)
 RSO # 784 by diluting contents to approx 40g
 w/ 0.1 N HCl in a 40 ml VOA vial.

1) Prepare 2L 0.1 M HCl by diluting 83 ml conc. HCl, Fischer
 Lot # 060506, in 2L DI water.

2) Transfer contents of ampoule to 40 ml VOA vial.
 Mass of VOA vial w/ lid = 24.9925g (Bal 12)
 vial + STD 784 = 29.7652g
 net std transferal = 4.7727g

3) Dilute w/ 0.1 ^{0.003514/06} M HCl

Mass of vial (from above) = 24.9925g
 vial + std + 0.1 M HCl = 64.2671g (Bal 12)
 net mass of std = 39.2746g

4) Final Activity Calc

$$\frac{(2.308 \times 10^4 \text{ dpm}) (60 \frac{\text{sec}}{\text{min}}) (4.7727 \text{ g})}{(5.00994 \text{ g}) (39.2746 \text{ g})} = 33,589.8 \frac{\text{dpm}}{\text{g}}$$

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

70035-307

Ra-228 5 mL Liquid in Flame Sealed Vial

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated using a germanium gamma spectrometer system.

Radionuclide purity and calibration were checked with a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

ISOTOPE:	Ra-228
ACTIVITY (dps):	2.308 E4
HALF-LIFE:	5.75 years
CALIBRATION DATE:	January 28, 2005 12:00 EST
RELATIVE EXPANDED UNCERTAINTY (k=2):	3.3%

Impurities: γ -impurities (other than decay products) <0.1%

5.00994 grams 0.1M HCl solution with 25 $\mu\text{g/g}$ Ba carrier.

11/17/08 ROI's set for all drawers using Sr90/Y90 planchets from Plateaus

11/18/08 Interim control limits set for efficiency and background calibrations. Efficiency control limits are 11/18/08 efficiency calibration check $\pm 10\%$. Background control limits are 11/17/08 background calibration $\pm 3\sigma$ counting uncertainty. Historical control limits will be set following the acquisition of 30 data points for efficiency and 10 data points for background calibrations.

11/18/08 Am 241 Wipe Calibration

Source: #746 Source ID: 1181 Logfile Am241Wipe-11/08

Filenames: EAW1118, A \rightarrow O

α to B crosstalk was calculated for each detector using the following equation: $\frac{\text{counts in Beta Channel}}{\text{counts in Alpha Channel}}$

11/18/08 Sr 90 Wipe Calibration

Source: #602 Source ID: 1182 Logfile: Sr90Wipe-11/08

Filenames: ESW1118, A \rightarrow O

B to α crosstalk was calculated for each detector using the following equation: $\frac{\text{Counts in Alpha Channel}}{\text{Counts in Beta Channel}}$

Prepare a working dilution of ~~RSD# 865~~ at ~10,000 dpm
~~RSD# 865.3610.07~~
 JDD 6/24/08

1) Density of 0.1 M HCl lot #068438 balance
 Mass of 100 ml volumetric flask 68.2945 g 12
 Mass of flask + 100 ml Acid 168.0504 g 12
 Net Mass of Acid = 99.7554 g 99.7509 g
 $\rho = \frac{99.7554 \text{ g}}{100 \text{ ml}} = 0.997554 \text{ g/ml}$
 $\rho = 0.997554 \text{ g/ml}$

2) Transfer Std.
 Mass of empty vial (No lid) 21.6922 g 12
 Mass of vial + std. Transferred 34.6989 g 12
 Net Mass of Std. Transferred 13.0067 g

3) Dilute w/ 0.1 M HCl
 Mass of Std, diluent, and vial 60.7240 g 12
 Mass of Vial 21.6922 g 12
 Net Mass of Dilution 39.0318 g

Activity Calculation

$$\left(\frac{30462.38 \text{ dpm}}{\text{g}} \right) \left(13.0067 \text{ g} \right) \left(\frac{0.997509 \text{ g/ml}}{0.997554 \text{ g/ml}} \right) = 10126.25 \text{ dpm}$$

39.0318 g

CERTIFICATE OF CALIBRATION
Standard Radionuclide Source

77540-307

Sr-89 50 mL Liquid in Flame Sealed Vial

Customer: Paragon Analytics

P. O. No.: 73625, Item 1

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated by liquid scintillation counting.

Radionuclide purity and calibration were checked by germanium gamma-ray spectrometry and liquid scintillation counting. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

Isotope:	Sr-89
Activity (Bq):	2.557 E4
Half-Life:	50.53 days
Calibration Date:	June 9, 2008 12:00 EST
Relative Expanded Uncertainty (k=2):	1.7 %

Comments:

Impurities: γ -impurities <0.1%

50.36376 grams 0.1M HCl solution with 30 $\mu\text{g/g}$ Sr carrier.

PROJECT

784.3020.38 Ra-228

Notebook No. _____

Continued From Page _____

Prepare approx 1L of Ra-228 at a working dilution of approx. 50 dpm/mL in 0.1 M HCl (TruChe Lot 060506)

1) Determine density of 0.1 M HCl

Mass of 100 mL "class A" flask = 62.4713 g
flask + 0.1 M HCl = 162.3059 g
Net mass of 100 mL 0.1 M HCl = 99.8346 g
Density = 0.9983 g/mL

2) Transfer approx 2 mL 784.3020.37 to 1L Nalgene bottle.

Mass of bottle w/ lid = 75.0497 g
bottle + std = 77.5897 g
Net mass of std = 2.5200 g

3) Dilute w/ 0.1 M HCl

Mass of bottle w/ lid (from above) = 75.0497 g
bottle + diluted std = 1073.4 g
998.4 g

4) Final Activity Calc.

$(33,589.8 \text{ dpm/g}) (2.5200 \text{ g}) (0.9983 \text{ g/mL}) = 84.6378 \text{ dpm/mL}$
(998.4 g)

Std ID: 784.3020.38

Prepare a primary dilution of (Analytes SRS 70085-307)
 RSO # 784 by diluting contents to approx 40g
 w/ 0.1 M HCl in a 40 ml VOA vial.

1) Prepare 2L 0.1 M HCl by diluting 83 ml conc. HCl, Fischer
 lot # 060506, in 2L DI water.

2) Transfer contents of ampoule to 40 ml VOA vial.
 Mass of VOA vial w/ lid = 24.9925g (Bal 12)
 vial + STD 784 = 29.7652g
 net std transferal = 4.7727g

3) Dilute w/ 0.1 M HCl

Mass of vial (from above) = 24.9925g
 vial + std + 0.1 M HCl = 64.2671g (Bal 12)
 net mass of std = 39.2746g

4) Final Activity Calc.

$$\frac{(2.308 \times 10^4 \text{ dps}) (60 \frac{\text{min}}{\text{hr}}) (4.7727 \text{ g})}{(5.00994 \text{ g}) (39.2746 \text{ g})} = 33,589.8 \frac{\text{dps}}{\text{g}}$$

CERTIFICATE OF CALIBRATION

Standard Radionuclide Source

70035-307 -

Ra-228 5 mL Liquid in Flame Sealed Vial

This standard radionuclide source was prepared gravimetrically from a calibrated master solution. The master solution was calibrated using a germanium gamma spectrometer system.

Radionuclide purity and calibration were checked with a germanium gamma spectrometer system. The nuclear decay rate and assay date for this source are given below.

ANALYTICS maintains traceability to the National Institute of Standards and Technology through Measurements Assurance Programs as described in USNRC Reg. Guide 4.15, Revision 1.

ISOTOPE:	Ra-228
ACTIVITY (dps):	2.308 E4
HALF-LIFE:	5.75 years
CALIBRATION DATE:	January 28, 2005 12:00 EST
RELATIVE EXPANDED UNCERTAINTY (k=2):	3.3%

Impurities: γ -impurities (other than decay products) <0.1%

5.00994 grams 0.1M HCl solution with 25 μ g/g Ba carrier.

December 17, 2012

SUBJECT: Sierrita VRP, Data Validation

Dear Mr. Henry,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on December 12, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 28908:

SDG #

Fraction

0812177 & 0905205	Radium-226, Radium-228, Gamma Spectroscopy, Isotopic Uranium, Gross Alpha Beta
-------------------	--

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- Addendum to Sampling & Analysis Plan, SAP, & Quality Assurance Project Plan, QAPP, Voluntary Remediation Program, VRP, Freeport-McMoran Sierrita, Inc., Green Valley Arizona, September 2008
- Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual, July 2004
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010

Please feel free to contact us if you have any questions.

Sincerely,

Andrew Kong
Project Manager

Introduction

This data review covers 14 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 903.1 for Radium 226.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the isotope was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the isotope was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination was performed at the required frequencies.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

A matrix spike (MS) analysis was not required by the method.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VI. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VII. Minimum Detectable Activity (MDA)

All minimum detectable activities met required detection limits.

VIII. Sample Result Verification

All sample result verifications were acceptable.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

No field duplicates were identified in this SDG.

Soil: 6 months or 5 half lives
Water: 6 months or 5 half lives

LDC #: 28708129

VALIDATION FINDINGS WORKSHEET
Level IV Recalculation Worksheet

METHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found} \times 100}{\text{True}}$$

Where, Found = activity of each analyte measured in the analysis of the sample.
True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where, S = Original sample activity
D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Reported		Acceptable (Y/N)

Introduction

This data review covers one soil sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per ALS SOP 724 Rev 10 for Radium 228.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the isotope was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the isotope was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination was performed at the required frequencies.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

A matrix spike (MS) analysis was not required by the method.

Duplicate (DUP) sample analyses were not required by the method.

VI. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VII. Carrier Recovery

All carrier recoveries were within validation criteria.

VIII. Minimum Detectable Activity (MDA)

All minimum detectable activities met required detection limits.

IX. Sample Result Verification

All sample result verifications were acceptable.

IX. Sample Result Verification

All sample result verifications were acceptable.

X. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XI. Field Duplicates

No field duplicates were identified in this SDG.

METHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found} \times 100}{\text{True}}$$

Where, Found = activity of each analyte measured in the analysis of the sample.
True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where, S = Original sample activity
D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Reported		Acceptable (Y/N)

Y	N	N/A
Y	N	N/A

Have results been reported and calculated correctly?

Are results within the calibrated range of the instruments?

Analyte results for Ra-228 reported with a positive detect were recalculated and verified using the following equation:

Concentration =

Recalculation:

$$\frac{(\text{cpm} - \text{background})}{2.22 \times E \times SA \times Vol}$$

$$\frac{2.6 - 2.06}{2.22(0.4168)(0.5085)(0.587)} \times 1.695 = 3.31 \text{ pCi/l}$$

E = Counter Efficiency

SA = Self-absorbance factor

Vol = Volume of sample

Introduction

This data review covers 21 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per ALS SOP 713 Rev 10 for Gamma Spectroscopy.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the isotope was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the isotope was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination was performed at the required frequencies with the following exceptions:

Sample	Isotope	Finding	Criteria	Flag	A or P
CP-SD-01-1.5-3.0 CP-SD-02-0-1.5 CP-SD-06-0-1.5 CP-SD-06-1.5-3.0 CP-SD-05-0-1.5 CP-SD-03-1.5-3.0 CP-Q09-1-3 CP-SD-01-1.5-3.0DUP	Radium-226	A mixed gamma source was used for calibration.	The laboratory should use a NIST certified Radium-226 source in the same geometry and configuration as the samples.	J (all detects) UJ (all non-detects)	A

Calibration results were within control limits with the following exceptions:

Date	Lab. Reference/ID	Isotope	% (Limits)	Associated Samples	Flag	A or P
1/13/09	Observed dead time	All isotopes	10.63 (≤ 10)	GS090106-3LCS	J (all detects) UJ (all non-detects)	P

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

A matrix spike (MS) analysis was not required by the method.

VI. Duplicate

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Minimum Detectable Activity

All minimum detectable activities met required detection limits with the following exceptions:

Sample	Isotope	Requested MDC	Lab MDC
CP-P07-1-3	Radium-228	1.0 pCi/g	1.3 pCi/g
CP-SD-04-0-1.5	Radium-228	1.0 pCi/g	1.6 pCi/g
CP-SD-04-1.5-3.0	Radium-228	1.0 pCi/g	1.5 pCi/g

The Lab MDC was greater than the Requested MDC as listed above.

IX. Sample Result Verification

All sample result verifications were acceptable with the following exceptions:

Sample	Isotope	Finding	Criteria	Flag	A or P
CP-SD-02-0-1.5 CP-SD-03-0-1.5 CP-SD-03-1.5-3.0 CP-SD-04-1.5-3.0 CP-Q09-1-3	Radium-228	Tentative identification requirements were not met.	Tentative identification must meet at least one of two requirements: peak identified above critical level or minimum library peak abundance attained.	J (all detects) UJ (all non-detects)	A
CP-P07-1-3 CP-P07-0-1 CP-SD-04-1.5-3.0 CP-P12-1-3	All isotopes	Greater than 15% density between the calibration standard and the sample.	Density should be $\leq 15\%$ between the calibration standard and the sample.	J (all detects)	A

X. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XI. Field Duplicates

No field duplicates were identified in this SDG.

VALIDATION FINDINGS WORKSHEET

Level IV Recalculation Worksheet

Page: 1 of 1Reviewer: CR2nd Reviewer: faMETHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found}}{\text{True}} \times 100$$

Where,

Found = activity of each analyte measured in the analysis of the sample.

True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where,

S = Original sample activity

D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Reported		Acceptable (Y/N)
					%R or RPD	%R or RPD	%R or RPD	%R or RPD	
LCS	Laboratory control sample	Am-241	1020	986	103		103		Y

Introduction

This data review covers 22 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per ALS SOP 714 Rev 11 for Isotopic Uranium.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the isotope was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the isotope was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination was performed at the required frequencies.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

A matrix spike (MS) analysis was not required by the method.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VI. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VII. Tracer Recovery

All tracer recoveries were within validation criteria.

VIII. Minimum Detectable Activity

All minimum detectable activities met required detection limits with the following exceptions:

Sample	Isotope	Requested MDC	Lab MDC
CP-SD-05-1.5-3.0	Uranium-238	0.1 pCi/g	0.11 pCi/g
CP-SD-03-1.5-3.0	Uranium-234	0.1 pCi/g	0.13 pCi/g
CP-P07-0-1	Uranium-234	0.1 pCi/g	0.11 pCi/g
CP-P07-5-7	Uranium-238	0.1 pCi/g	0.11 pCi/g
OD-SD-02-0-1.5	Uranium-234	0.1 pCi/g	0.16 pCi/g

The Lab MDC was greater than the Requested MDC as listed above.

IX. Sample Result Verification

All sample result verifications were acceptable.

X. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XI. Field Duplicates

No field duplicates were identified in this SDG.

VALIDATION FINDINGS WORKSHEET
Level IV Recalculation WorksheetMETHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found}}{\text{True}} \times 100$$

Where, Found = activity of each analyte measured in the analysis of the sample.
True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where, S = Original sample activity
D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Acceptable (Y/N)
					%R or RPD	Reported %R or RPD	
LC3	Laboratory control sample	U-238	5.33	5.23	102	102	Y
N	Matrix spike sample						
21	Duplicate RPD	U-238	2.12 $2\sigma = 0.42$	2.13 $2\sigma = 0.44$	0.16	0.25	Y
1	Chemical recovery	U-238	3.58	4.418	81	81	Y

Comments: Refer to appropriate worksheet for list of qualifications and associated samples when reported results do not agree within 10.0% of the recalculated results.

METHOD: Radiochemistry (Method: See cover)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y	N	N/A
Y	N	N/A

Have results been reported and calculated correctly?

Are results within the calibrated range of the instruments?

Analyte results for U-234/238 reported with a positive defect were recalculated and verified using the following equation: 26.71

Concentration =

U-234: 1 = $\frac{265.7}{2.22(0.3107)(0.8226)(300 \text{ min})(1g)} = 1.56 \text{ pCi/g}$

$$\frac{(\text{cpm} - \text{background})}{2.22 \times E \times SA \times Vol}$$

E = Counter Efficiency
SA = Self-absorbance factor
Vol = Volume of sample

$$U-238 = 11.2 \frac{211.1}{2.22(1.002)(0.2813)(0.8663)(300 \text{ min})(0.59)} = 2.516 \text{ pCi/g}$$

Introduction

This data review covers 28 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per ALS SOP 724 Rev 10 for Gross Alpha and Beta Radioactivity.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Isotope	Total Time From Sample Collection Until Analysis	Required Holding Time From Sample Collection Until Analysis	Flag	A or P
MW-2008-14-2-63 MW-2008-14-4-Calcite-48 MW-2008-14-3-124 MW-2008-14-4-159 MW-2008-15-1F-4 MW-2008-15-1C-16 MW-2008-15-2F-29 MW-2008-15-2C-30 MW-2008-15-3F-40 MW-2008-15-3C-42 MW-2008-15-4F-52 MW-2008-15-4C-55 MW-2008-15-1F-4DUP	Gross alpha Gross beta	406 days	6 months	J (all detects) R (all non-detects) J (all detects) R (all non-detects)	P
MW-2008-12-1F-13 MW-2008-12-1C-22 MW-2008-12-1F-ORG MW-2008-12-2F-39 MW-2008-12-2C-40 MW-2008-12-3F-58 MW-2008-12-3C-63 MW-2008-13-2C-28 MW-2008-13-2F-37 MW-2008-13-3C-51 MW-2008-13-3F-52 MW-2008-13-4F-58 MW-2008-13-4C-69 MW-2008-13-2F-37MS MW-2008-13-2F-37DUP	Gross alpha Gross beta	372 days	6 months	J (all detects) R (all non-detects) J (all detects) R (all non-detects)	P

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined and a self-absorption curve was generated for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination were performed at the required frequencies. Results were within laboratory control limits.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VI. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VII. Minimum Detectable Activity (MDA)

All minimum detectable activities met required detection limits.

VIII. Sample Result Verification

All sample result verifications were acceptable.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

No field duplicates were identified in this SDG.

VALIDATION FINDINGS WORKSHEET
Level IV Recalculation Worksheet

Page: 1 of 1
Reviewer: CR
2nd Reviewer: N

METHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found} \times 100}{\text{True}}$$

Where, Found = activity of each analyte measured in the analysis of the sample.
True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where, S = Original sample activity
D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Acceptable (Y/N)
					%R or RPD	Reported %R or RPD	
LCS	Laboratory control sample	Grossd	13.4	13.1	88.7	87.3	Y
26	Matrix spike sample	GrossB	15.5	14.3	10.8	10.9	Y
27	Duplicate RPD	Grossd	13 20=3.1	14 20=3.1	0.11	0.04	Y
N	Chemical recovery						

Comments: Refer to appropriate worksheet for list of qualifications and associated samples when reported results do not agree within 10.0% of the recalculated results.

Introduction

This data review covers 28 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per ALS SOP 713 Rev 10 for Gamma Spectroscopy.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the isotope was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the isotope was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination was performed at the required frequencies with the following exceptions:

Sample	Isotope	Finding	Criteria	Flag	A or P
All samples in SDG 0905205	Radium-226	A mixed gamma source was used for calibration.	The laboratory should use a NIST certified Radium-226 source in the same geometry and configuration as the samples.	J (all detects) UJ (all non-detects)	A

Calibration results were within control limits.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

A matrix spike (MS) analysis was not required by the method.

VI. Duplicate

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Minimum Detectable Activity

All minimum detectable activities met required detection limits with the following exceptions:

Sample	Isotope	Requested MDC	Lab MDC
MW-2008-14-2-63	Radium-228	1.0 pCi/g	1.1 pCi/g
MW-2008-13-3F-52	Radium-228	1.0 pCi/g	1.1 pCi/g
MW-2008-13-4F-58	Radium-228	1.0 pCi/g	1.3 pCi/g
MW-2008-15-1F-4DUP	Radium-228	1.0 pCi/g	1.1 pCi/g
MW-2008-15-1C-16	Radium-228	1.0 pCi/g	1.1 pCi/g

The Lab MDC was greater than the Requested MDC as listed above.

IX. Sample Result Verification

All sample result verifications were acceptable with the following exceptions:

Sample	Isotope	Finding	Criteria	Flag	A or P
MW-2008-15-4F-52	Radium-228	Tentative identification requirements were not met.	Tentative identification must meet at least one of two requirements: peak identified above critical level or minimum library peak abundance attained.	J (all detects) UJ (all non-detects)	A
MW-2008-14-2-63 MW-2008-12-1F-13 MW-2008-12-1C-22 MW-2008-12-1F-ORG MW-2008-12-2F-39 MW-2008-12-2C-40 MW-2008-12-3F-58 MW-2008-12-3C-63 MW-2008-13-4C-69 MW-2008-15-2F-29 MW-2008-15-2C-30 MW-2008-15-3F-40 MW-2008-15-3C-42 MW-2008-15-4F-52 MW-2008-15-4C-55 MW-2008-14-2-63DUP MW-2008-12-2F-39DUP	All isotopes	Greater than 15% density between the calibration standard and the sample.	Density should be $\leq 15\%$ between the calibration standard and the sample.	J (all detects)	A

X. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XI. Field Duplicates

No field duplicates were identified in this SDG.

2nd Reviewer: hMETHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found} \times 100}{\text{True}}$$

Where, Found = activity of each analyte measured in the analysis of the sample.
True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where, S = Original sample activity
D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Reported		Acceptable (Y/N)
					%R or RPD	%R or RPD	%R or RPD	%R or RPD	
LCS	Laboratory control sample	Ra-226	452	470	96.2		96.2		Y
N	Matrix spike sample								
26	Duplicate RPD DER	Ra-226	1.7 20 = 0.36	2.2 20 = 0.43	0.89		0.80		Y
N	Chemical recovery								

Comments: Refer to appropriate worksheet for list of qualifications and associated samples when reported results do not agree within 10.0% of the recalculated results.

Introduction

This data review covers 28 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per ALS SOP 714 Rev 11 for Isotopic Uranium.

This review follows the Addendum to Sampling & Analyses Plan (SAP) & Quality Assurance Project Plan (QAPP), Voluntary Remediation Program (VRP), Freeport-McMoran Sierrita, Inc., Green Valley Arizona (September 2008), the Multi Agency Radiological Laboratory Analytical Protocols (MARLAP) Manual (July 2004), and a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the isotope was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the isotope was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

Detector efficiency was determined for each radionuclide of interest.

III. Continuing Calibration

Continuing calibration and background determination was performed at the required frequencies.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. Blank results contained less than the minimum detectable activity (MDA).

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

A matrix spike (MS) analysis was not required by the method.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VI. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VII. Tracer Recovery

All tracer recoveries were within validation criteria.

VIII. Minimum Detectable Activity

All minimum detectable activities met required detection limits.

IX. Sample Result Verification

All sample result verifications were acceptable.

X. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XI. Field Duplicates

No field duplicates were identified in this SDG.

VALIDATION FINDINGS WORKSHEET

Level IV Recalculation Worksheet

Page: 1 of 1Reviewer: CR2nd Reviewer: WMETHOD: Radiochemistry (Method: see cover)

Percent recoveries (%R) for a laboratory control sample, a matrix spike and a matrix spike duplicate sample were recalculated using the following formula:

$$\%R = \frac{\text{Found}}{\text{True}} \times 100$$

Where, Found = activity of each analyte measured in the analysis of the sample.

True = activity of each analyte in the source.

A matrix spike and matrix spike duplicate relative percent difference (RPD) was recalculated using the following formula:

$$RPD = \frac{|S-D|}{(S+D)/2} \times 100$$

Where, S = Original sample activity
D = Duplicate sample activity

Sample ID	Type of Analysis	Analyte	Found/S (units)	True/D (units)	Recalculated		Reported		Acceptable (Y/N)
					%R or RPD		%R or RPD		
LC5	Laboratory control sample	U-238	4.19	4.49	93.3		93.4		Y
N	Matrix spike sample								
26	Duplicate RPD	U-234	0.77 2σ = 0.8	0.94 2σ = 0.21	0.61		0.62		Y
1	Chemical recovery	U-232	4.00	4.442	90		90		Y

Comments: Refer to appropriate worksheet for list of qualifications and associated samples when reported results do not agree within 10.0% of the recalculated results.
